Third Party Integrations

Third Party Integrations settings enable you to integrate external tools such as ClamAV, ICAP and reCaptcha with FileCloud. If you are using the Advanced edition, you can set up access to FileCloud through Salesforce or include security information, CASB, and event management (SIEM) software features in FileCloud.

In this section:

Enable Antivirus Scanning

Internet Content Adaptation Protocol (ICAP) antivirus integration is available in FileCloud version 18.2

Notes:

- The antivirus security feature works on both Linux and Windows.
- The antivirus product may or may not be deployed on the same server as the one running the FileCloud instance.
- Antivirus scanning applies when files are uploaded to FileCloud.
- Virus scanning of a file is scheduled as soon as file upload is complete.
- Virus scanning is managed by FileCloud.

You must address virus scanning as it is a critical security feature, especially when file storage is involved.

- FileCloud allows users to upload files with arbitrary content.
- It is of utmost importance to make sure that the uploaded files are checked for malicious content in the form of viruses, trojans, malware, etc.
- FileCloud readily integrates with a variety non-commercial and commercially licensed antivirus solutions available in the market.

You can configure FileCloud to scan uploaded files in the following ways:

- Use ClamAV, an open source antivirus software that is included with FileCloud.
- Use ICAP to integrate your own choice of antivirus scanning software with FileCloud.

What is ICAP?

Internet Content Adaptation Protocol (ICAP) is a generic protocol that allows web servers to offload specialized tasks. This delegation is helpful when the tasks require custom-built servers.

Examples of such specialized tasks include:

- DLP (data loss prevention) based content scanning
- URL filtering
- antivirus scanning

Which do I use, ClamAV or ICAP?

If you have already purchased your own anti-virus solution and want to use it, then choose ICAP.

If you do not want to use ClamAV for various reasons, then choose ICAP.

If you want to use antivirus scanning included with FileCloud, then choose ClamAV.

Which solution do you want to use?

Neither of these options provides protection for the server on which FileCloud is deployed. The antivirus solution configured here applies only for the uploaded files.

- [ClamAV](#)

- [ICAP](#)

Use ClamAV Antivirus Scanning

 FileCloud does not provide support for ClamAV or its virus signature databases, which are third-party software applications. If you need assistance with your ClamAV configuration or setup please check the [ClamAV Troubleshooting FAQ](#).

 ClamAV integration with Azure/S3 external networks is not supported.

You can configure FileCloud to scan uploaded files using ClamAV, an open source antivirus software.

ClamAV is available for:

- Windows
- Linux

When a virus is detected in an uploaded file, the following actions occur:

1. The incoming file is deleted.
2. An alert is displayed in the admin portal.
3. A toast is displayed in the user portal.
4. An entry is added in the audit log about virus detection in the file and subsequent deletion of the file.

To Use ClamAV

Install ClamAV in Ubuntu

These instructions are for Ubuntu Linux, but they can be used for other Linux systems using equivalent commands.

To install ClamAV in Ubuntu:

1. Install the ClamAV package

```
sudo apt-get install clamav-daemon
```

2. You might need to run 'freshclam' to update the antivirus database files

```
sudo freshclam
```

3. Update the ClamAV-Daemon mode to use TCP, by running the `sudo dpkg-reconfigure clamav-base`

```
sudo dpkg-reconfigure clamav-daemon
```

4. In the reconfigure wizard, choose Socket Type TCP and Interface as localhost to listen to.
5. After reconfigure finishes, verify the clamd.conf file is setup correctly (/etc/clamav/clamd.conf)

NOTE: TCPAddr localhost may not work. You can enter the filecloud URL in place of TCPAddr to make it work

```
TCPsocket 3310
TCPAddr localhost
StreamMaxLength 100M
```

6. Additional commands for Ubuntu 16

```
#The Socket Configuration changes are also required as below:

#Edit the file /etc/systemd/system/clamav-daemon.service.d/extend.conf

[Socket]
SocketUser=clamav
ListenStream=/var/run/clamav/clamdctl
SocketGroup=clamav
SocketMode=666
ListenStream=xx.xx.xx.xx:3310

# Note that xx.xx.xx.xx = IP address of server or 127.0.0.1

#After that run:

systemctl --system daemon-reload
systemctl restart clamav-daemon.service
```

7. Start ClamAV-Daemon

```
sudo /etc/init.d/clamav-daemon start
```

Install ClamAV on Windows

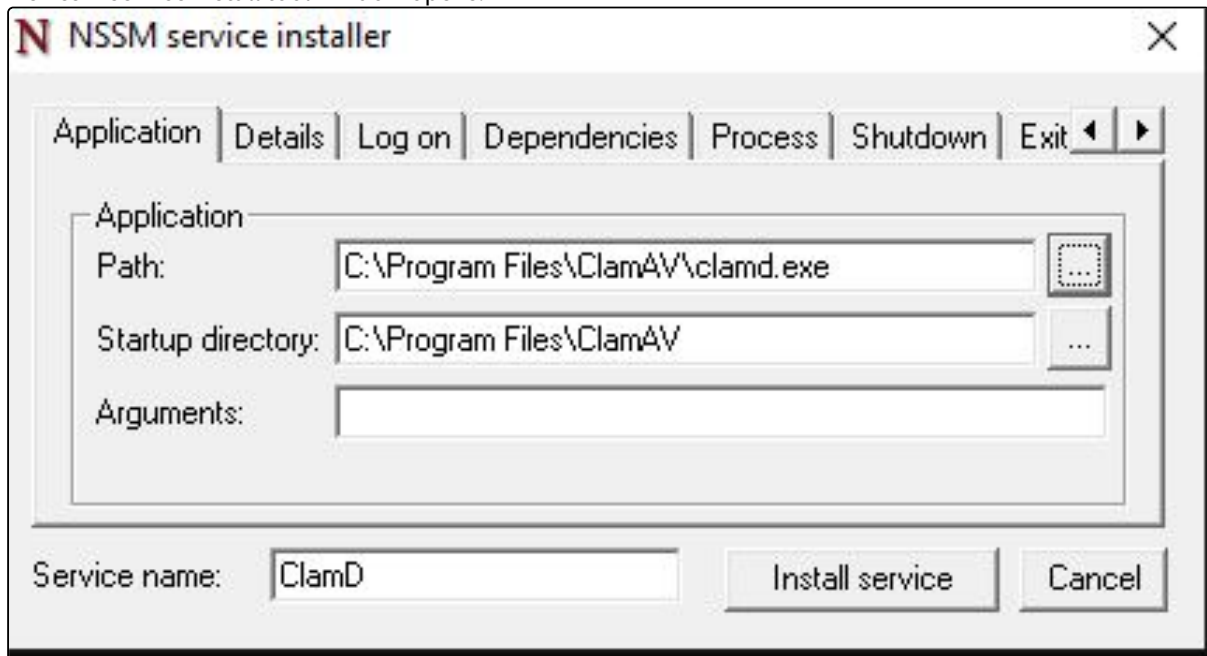

- The native ClamAV version does not have a GUI.
- The virus database definition can be updated using freshclam using a Windows task scheduler.

To install ClamAV on Windows:

1. Download the latest version of the ClamAV installer from:
<http://www.clamav.net/downloads>
2. Install ClamAV by running the latest msi file downloaded.
3. Download the nssm Service Manager from:
<https://patch.codelathe.com/tonidocloud/live/3rdparty/nssm/nssm.zip>
4. Unzip the nssm folder and move the nssm folder to the C:\ drive or, if you are installing ClamAV in the FileCloud Server, to the C:\xampp folder.
5. Navigate to the nssm folder in the command line and run the following command:

```
C:\nssm>nssm install clamd
```

The nssm service install tool window opens:

6. To install the service, select the clamd.exe file path in **Application Path** and click **Install Service**.
7. Copy **clamd.conf.sample** and **freshclam.conf.sample** from **C:\Program Files\ClamAV\conf_examples** to **C:\Program Files\ClamAV**, and rename them **clamd.conf** and **freshclam.conf**
8. In **clamd.conf** and **freshclam.conf**, comment out the line beginning with *Example*.
9. If ClamAV is installed on a server other than the FileCloud server:
Bind the IP address of the server in **clamd.conf** by changing the IP address for **TCPAddr**.
10. To update the ClamD database, enter:

```
cd C:\Program Files\ClamAV
freshclam.exe
```

The console response should appear similar to:

```
C:\Program Files\ClamAV>freshclam.exe
ClamAV update process started at Thu Mar 25 07:42:28 2021

```

11. Start the service **ClamD** from Windows Services.
12. Verify the service is running and bind it to the localhost IP address or the IP address of the ClamAV server by running the following command:

```
netstat -ano |findstr 3310
```

Integrate ClamAV with FileCloud

Once ClamAV is set up and started, add details of the ClamAV service to FileCloud.

To integrate ClamAV with FileCloud:

1. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on

the **Settings** navigation page, click **Third Party Integrations** .

The **Antivirus** page opens by default.

2. In **Anti-Virus Type**, choose **Clam AV**.

Clam Antivirus settings appear.

Antivirus

[Reset to defaults](#)

Antivirus type

Select an Anti-Virus type to configure

CLAM AV ▾

Clam Antivirus settings

Check ClamAV

ClamAV Test

ClamAV host

ClamAV port

File size limit

Files larger than this size will not be scanned.

Units ▾
Bytes

Stream chunk size

(Advanced) Chunk size (in bytes) to use when uploading to the server.

3. Enter the following information:

Setting	Description
ClamAV Host	Enter the URL or IP of the system where Clam AV is running. This can be local or remote system.
ClamAV Port	The port used by ClamAV (This is set when ClamAV is installed in the previous section)
Skip scanning for files greater than	This is the file limit in bytes that will be scanned. For example, very large files can be excluded from scanning. Default value is 25MB
Stream Chunk Size	This is a advanced setting used to stream the file content to ClamAV for scanning. Default is 8KB.

4. Click **Save**.

5. To verify connectivity, click the **ClamAV Test** button.

-  Once the ClamAV configuration is set up, every file uploaded to FileCloud will be scanned before being added to FileCloud storage.
- If a file fails AV check (i.e. a virus detected) then the file will be deleted and an entry will be added to the Audit log with the details of the file.

If scanning fails

If scanning fails because the ClamAV server is down, a message appears on your screen, and your Manage Alerts page displays the warning:

Unable to communicate with ClamAV Server. Check immediately.

By default, if ClamAV fails to scan a file because the ClamAV server is down, the file is not deleted.

To automatically delete files if ClamAV scan fails because the ClamAV server is unavailable:

1. Open the configuration file:
Windows: XAMPP DIRECTORY/htdocs/config/cloudconfig.php
Linux: /var/www/config/cloudconfig.php
2. Add the line:

```
define("TONIDOCLOUD_CLAMAV_DELETE_ON_SCAN_FAIL", "1");
```

Now, when scan fails, the file is deleted, and the audit log displays the message: **ClamAV removed [FILE_PATH] due to scan fail.**

If TONIDOCLOUD_CLAMAV_DELETE_ON_SCAN_FAIL is enabled and the CLAMAV server is not available, FileCloud does not allow files to be uploaded.

Use ICAP Antivirus Scanning

FileCloud uses Internet Content Adaption Protocol (ICAP) to integrate with any antivirus product currently supporting ICAP.

What is ICAP?

ICAP is a generic protocol that allows web servers to offload specialized tasks to custom-built servers. Examples of such specialized tasks include DLP (data loss prevention) based content scanning, URL filtering and antivirus scanning.

FileCloud's ICAP integration feature:

- Works on both Linux and Windows servers
- Is part of FileCloud server itself
- Provides flexibility and scalability - the ICAP antivirus server does not have to be deployed on the same server as the one running the FileCloud server instance.
- Triggers virus scanning only when files are uploaded to FileCloud.
- Scanning is scheduled "inline" as soon as the file upload is completed

 If you have already purchased your own antivirus solution and want to use it, or if you do not want to use ClamAV for various reasons, we highly recommended using this feature.

We also recommend that the ICAP Antivirus server administrator consult the antivirus product documentation to understand the operational and configuration parameters, capabilities and limitations. As virus scanning is a critical feature for maintaining water-tight security and smooth functioning of any workplace, consulting the documentation is important before configuring FileCloud's ICAP integration settings, it would also help in troubleshooting and maintenance.

How ICAP detects a virus

After a file is scanned, FileCloud checks for the following response headers on the file scanning result:

- X-Infection-Found
- X-Violations-Found
- X-Virus-ID

If any of these headers are found, FileCloud performs the actions listed below, under **When ICAP detects a virus**.

When ICAP detects a virus

Similar to the case of ClamAV, if FileCloud's ICAP Client has been configured correctly with a properly deployed ICAP AV server, when a virus is detected in an uploaded file, the following actions occur:

1. The incoming file is deleted.
2. An alert is displayed in the Admin Portal.
3. A toast is displayed in the User Portal.
4. An entry is added in the audit log about virus detection in the file and subsequent deletion of the file.

Integrating ICAP with FileCloud

Using ICAP to integrate Antivirus capabilities into FileCloud requires customers to:

1. Set up an ICAP antivirus server.
2. Configure FileCloud's inbuilt ICAP client to access your antivirus server.

FileCloud has made it easy for administrators to connect FileCloud to your antivirus server by including an inbuilt ICAP Client.

The configuration steps apply to both Windows and Linux servers.

To configure FileCloud to use your antivirus server:

1. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on

the **Settings** navigation page, click **Third Party Integrations**.
The **Antivirus** page opens by default.

2. In **Anti-Virus Type**, choose **ICAP AV**.

Typically 1344 for regular ICAP or 11344 for secure ICAP.

1344

Secure ICAP

Enable if the ICAP server is running with SSL or TLS protocols.

File size limit

Files larger than this size will not be scanned.

Units

23.89

Bytes

ICAP service name

Enter the name of the ICAP server provided for this ICAP service.

SYMCSanReq-AV

Enable basic debug logging

Include details of interactions with this ICAP service in FileCloud logs.

Enable network payload debug logging

Include the full payload of transfers to and from this ICAP service in FileCloud logs.

3. Configure the various parameters for the ICAP Client as described below.

Setting	Description
Server local IP	In most cases, leave the default value of 0.0.0.0. If you are using a separate FileCloud policy with ICAP, enter the Private (LAN) IP of the FileCloud server.

Setting	Description
ICAP remote hostname	Enter the hostname or IP of the system where the ICAP AV is deployed.
ICAP port	Leave the default value of 1344 as it is. In rare cases, this might need to be changed to whatever port the ICAP AV server is listening on.
Secure ICAP	Enable if the ICAP server is running with SSL or TLS protocols.
File size limit	This is the file limit in bytes that will be scanned. For example, very large files can be excluded from scanning. Default value is 25MB
ICAP service name	Consult the ICAP AV server product documentation to know this value. It must be set correctly otherwise integration won't work.
Enable basic debug logging	Check this to enable logging of detailed operational debug messages in the (error) logs.
Enable network payload debug logging	Check this to enable logging of detailed network communication related debug messages in the (error) logs.

4. To save your changes, click **Save**.

5. To confirm that the configuration has been done correctly, click **ICAP Test**.

User details sent with scan requests

To help the ICAP server determine if a scan is required, the following headers are sent with every scan request:

Header X-FILECLOUD-USER-NAME - name of user performing the upload.

Header X-FILECLOUD-USER-EMAIL - email of user performing the upload.

Header X-FILECLOUD-USER-TYPE - type of user performing the upload. Possible values are "full", "guest", and "external".

Header X-FILECLOUD-GROUP-NAMES - comma-separated list of group names that user performing the upload is a member of.

To disable sending of these headers:

1. Open the configuration file:
Windows: XAMPP DIRECTORY/htdocs/config/cloudconfig.php
Linux: /var/www/config/cloudconfig.php
2. Add the line:

```
define("TONIDOCLOUD_ICAPAV_DISABLE_ADDITIONALHEADERS", "1");
```

If scanning fails

If scanning fails because the ICAP server is down, a message appears on your screen, and your Manage Alerts page displays the message:

☐ 2020-Jul-29 07:06 PM Warning Unable to communicate with ICAP/AV Server. Check immediately.

By default, if ICAP fails to scan a file because the ICAP server is down, the file is not deleted.

To automatically delete files if ICAP scan fails because the ICAP server is unavailable:

1. Open the configuration file:
Windows: XAMPP DIRECTORY/htdocs/config/cloudconfig.php
Linux: /var/www/config/cloudconfig.php
2. Add the line:

```
define("TONIDOCLOUD_ICAP_DELETE_ON_SCAN_FAIL",1);
```

Now, when scan fails, the file is deleted, and the audit log displays the message: *ICAP removed [FILE_PATH] due to scan fail.*

 If TONIDOCLOUD_ICAP_DELETE_ON_SCAN_FAIL is enabled and the ICAP server is not available, FileCloud does not allow files to be uploaded.

To extend the allowed response time before an ICAP scan request fails:

1. Open the configuration file:
Windows: XAMPP DIRECTORY/htdocs/config/cloudconfig.php
Linux: /var/www/config/cloudconfig.php
2. Add the line:

```
define("TONIDOCLOUD_ICAP_AV_TIMEOUT",80);
```

Where the value entered specifies that amount of response time allowed in seconds. As the default allowed response time is 60 seconds, the value should be higher than 60 to increase the allowed response time.

Integrating FileCloud with Salesforce

 The Salesforce Plugin reached End-of-Sale (EoS) on June 1, 2025 and is no longer be available for download or new installations.
EoS will be followed by End-of-Life (EoL) on September 1, 2025, at which point support will no longer be generally available for the Salesforce Plugin.
FileCloud will continue to offer technical support to customers with active support contracts for the Salesforce Plugin until the defined EoL date. No replacement product is planned.

Salesforce Integration

FileCloud makes files stored in any on-premises, public or hybrid cloud available within Salesforce. To configure this function, integrate FileCloud with Salesforce.

Key benefits:

- Upload, download, access and share remote files from within Salesforce.
- Store files on-premises or in the public cloud (Amazon AWS, Microsoft Azure). Access files securely inside Salesforce from anywhere.
- Share files and collaborate with team members, even if they are not Salesforce users.
- Integrate Salesforce with existing file servers and file permissions.
- Get advanced file analytics about who has shared and downloaded files.
- Link FileCloud content to specific Salesforce records.

Limitations

- To be able to integrate FileCloud with Salesforce, you must have the Salesforce component in your license.
- You cannot give External users access to FileCloud's integration with Salesforce.
- Only one Salesforce account and one FileCloud account can be mapped together. Mapping occurs the first time the user logs in to FileCloud through Salesforce. If a user tries to map a second FileCloud account to a Salesforce account, or a second Salesforce account to a FileCloud account, an error message is returned.

To integrate FileCloud with Salesforce, create a Salesforce Team Folder in FileCloud. When you create Salesforce objects (Accounts, Cases, Contacts, etc.), sub-folders are created in the Salesforce Team Folder in FileCloud for each object.

You can access FileCloud in the Salesforce interface to access the an object's Team Folders to perform FileCloud operations on them.

The screenshot shows the Salesforce interface with the 'FileCloud CCP' tab selected. The 'Accounts' menu is open, and the 'Specialty Coating Systems' account is selected. The 'FileCloud' tab is active, showing a breadcrumb navigation path: [teamfold123](#) > [Salesforce](#) > [Account](#) > [Specialty Coating Systems-001DT000018Nul8YAC](#). An orange arrow points from the 'Billing Address' field in the account details to the team folder link. Below the breadcrumb, there is a search bar and a table of files.

Team folder created in FileCloud for the SalesForce Account object Specialty Coating Systems

Upload Files Or drop files

Search File

Name	Type	Size	Modify D...	Download
New Folder	Folder		Nov 29, 2...	
0bfile.txt	txt	1 B	Nov 29, 2...	

You can configure the Salesforce Team Folders so that only the owner (creator) of the object and users you have designated as managers have access to each object's Team Folder. If you do not add this configuration, anyone with access to the parent Salesforce Team Folder has access to all objects' Team Folders.

Adding FileCloud to Salesforce

To integrate FileCloud with Salesforce:

1. Access <https://appexchange.salesforce.com/> and login with your Salesforce credentials

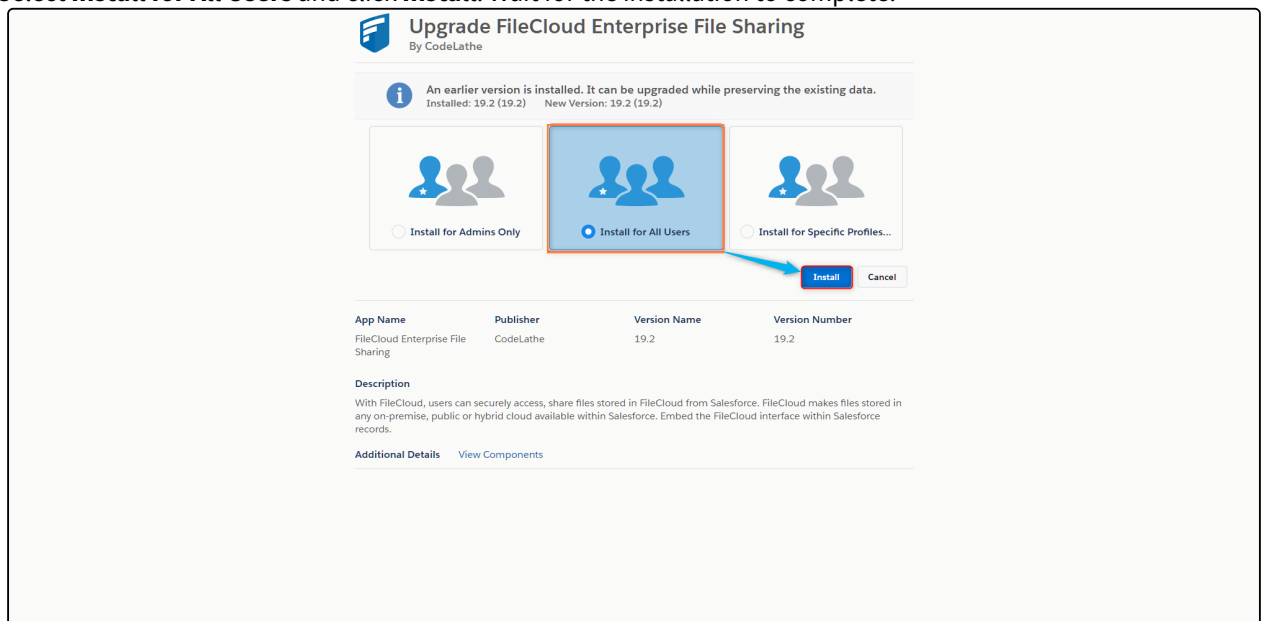

2. In the Search bar, enter **FileCloud Enterprise File Sharing**, and click the listing to enter our FileCloud App for Salesforce.

3. Click **Get it Now**. In the pop-up window, select **Install in Production**.

4. Select **Install for All Users** and click **Install**. Wait for the installation to complete.

Uninstalled Packages
No uninstalled package data archives

5. In the upper-right of the screen, click the **Setup** icon, and choose **Setup**.

The screenshot shows the top navigation bar of the Salesforce interface. A dropdown menu is open, showing options: Setup, Your Account, Developer Console, and Edit Page. The 'Setup' option is highlighted with a red arrow. Another red arrow points to the gear icon (Setup icon) in the top navigation bar.

6. In the navigation panel, scroll down to **Security** and expand it. Click **Remote Site Settings**.

The **Remote Site Settings** screen opens to the **All Remote Sites** view.

7. Click **New Remote Site**.

The screenshot shows the FileCloud Server Setup interface. The top navigation bar includes 'Sandbox: newSandbox | Log out'. The left sidebar lists various setup categories: Identity, Security (expanded), Activations, CORS, Certificate and Key Management, Expire All Passwords, Field Accessibility, File Upload and Download Security, Health Check, Login Access Policies, Named Credentials, Network Access, and Password Policies. The main content area is titled 'Remote Site Settings' and 'All Remote Sites'. It includes a 'View: All Remote Sites' dropdown and a 'Create New View' link. Below this is a table with columns: Action, Remote Site Name, Namespace Prefix, Remote Site URL, Active, Created By, and Created Date. An orange arrow points to the 'New Remote Site' button located above the table. The bottom of the screen shows a Windows taskbar with various application icons.

8. Add the FileCloud **Remote Site Name** and **Remote Site URL**, and click **Save**.

The screenshot displays the Salesforce Setup interface. At the top, the header shows "Sandbox: newSandbox | Log out". Below the header is a navigation bar with "Setup", "Home", and "Object Manager" tabs. A search bar labeled "Search Setup" is also present. The left sidebar contains a list of setup categories, with "Remote Site Settings" highlighted. The main content area is titled "Remote Site Settings" and "Remote Site Edit". It includes a description: "Enter the URL for the remote site. All s-controls, JavaScript OnClick commands in custom buttons, Apex, and AJAX proxy calls can access this Web address from salesforce.com." The form fields are as follows:

- Remote Site Name:** FileCloud
- Remote Site URL:** https://my-filecloud-url.com
- Disable Protocol Security:** ☐ (disabled)
- Description:** (empty text area)
- Active:** ☒

Buttons for "Save", "Save & New", and "Cancel" are located at the top and bottom of the form.

The remote FileCloud site is listed in the **All Remote Sites** view.

SETUP

9. In the navigation panel, go to **Security > Session Settings**.

12. From the App Launcher, click FileCloud EFSS.

Installation is complete.

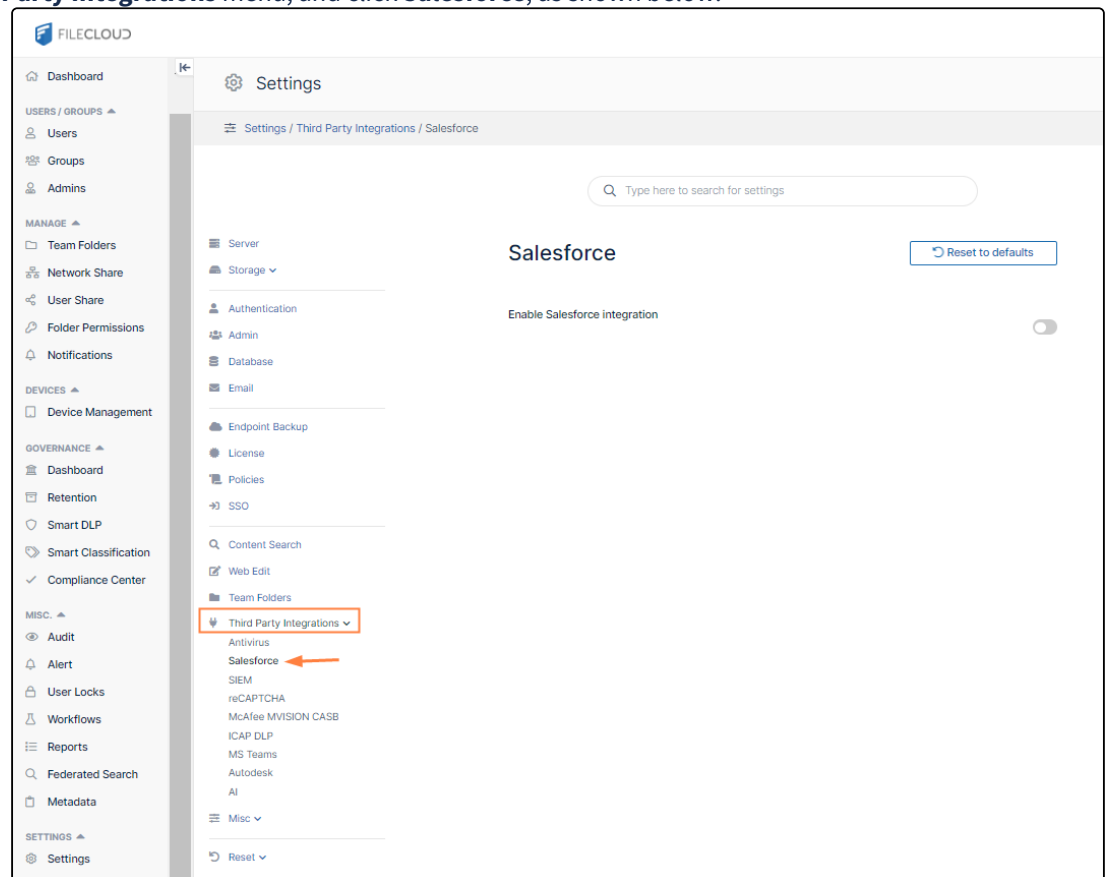

Configuring FileCloud with Salesforce

After you install/integrate FileCloud with Salesforce, complete the following:

1. Edit the **.htaccess** file.
 - a. Windows: go to **C:\xampp\htdocs**
Linux: go to: **/var/www/html/config**
 - b. Open the file **.htaccess**
 - c. Locate **Header set Content-Security-Policy** and in the list following **frame-ancestors**, append ***.visualforce.com *.lightning.force.com *.my.salesforce.com, *.vf.force.com;**
The edit is shown in the highlighted portion below:

```
<IfModule mod_headers.c>
Header set X-Frame-Options "SAMEORIGIN"
Header set X-Content-Type-Options "nosniff"
Header set Strict-Transport-Security "max-age=31536000; includeSubDomains"
Header set X-XSS-Protection "1; mode=block"
Header set Content-Security-Policy: "default-src 'self' blob: *.live.com *.amazonaws.com *.core.windows.net www.google.com http://127.0.0.1:34320/v1/fileassociations *.autodesk.com; \
style-src 'unsafe-inline' 'self' *.autodesk.com; \
script-src 'unsafe-inline' 'unsafe-eval' 'self' www.google.com www.gstatic.com teams.microsoft.com *.teams.microsoft.com *.skype.com *.autodesk.com; \
frame-src 'self' www.google.com *.live.com docs.google.com accounts.google.com; \
font-src 'self' data: *.autodesk.com; \
img-src www.gstatic.com 'self' data: blob: *.duosecurity.com *.live.com *.amazonaws.com *.core.windows.net *.office.net *.autodesk.com; \

Header set Cache-Control no-cache="Set-Cookie"
</IfModule>
```

2. Configure Salesforce in FileCloud.
 1. In the FileCloud admin portal, open the **Salesforce** settings page.
To go to the Salesforce settings page
 - i. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on the **Settings** navigation page, click **Third Party Integrations** .
 - ii. In the inner navigation bar on the left of the **Third Party Integrations** page, expand the **Third Party Integrations** menu, and click **Salesforce**, as shown below.

The **Salesforce** settings page opens.

- b. Enable the **Enable Salesforce integration** setting.
- c. Click **Generate Secret**, then copy the key and click **Save**.
- d. In FileCloud Team Folders, create a Team Folder named **Salesforce**. Sub-folders for your Salesforce objects will automatically be created in this Team Folder. (If you have given the folder another name, but make sure you change the folder name entered in **Salesforce team folder name** to match it.)

Salesforce

Supported Salesforce object types

Comma-separated list of Salesforce object types to be automatically handled in FileCloud.

account,lead,contact,opportunity,...

Salesforce team folder name

Name of the main directory that stores all files/folders related to Salesforce objects

Salesforce

Authentication method

Authentication method when using FileCloud in Salesforce.

Always require login - FileCloud login panel appears on access request.

Allow silent Login - If user account is mapped and approved, authentication occurs 'silently' in the background without user interaction.

Always require login ▼

Approval required

Specifies whether authentication approval is required to add another layer of security. User must log in to FileCloud at specified intervals (for example, once daily) to prove their identity.

☒

Approval cookie validity time

How long the cookie set up for the user approval process is valid (in seconds)

180

Approval validity time

How long the account approval is valid (in seconds)

86400

3. Configure which users have access to FileCloud's integration with Salesforce.
 - a. In the Salesforce **App Manager**, click the drop-down list across from **FileCloud EFSS**, and click **Manage**.
 - b. Click **Edit Policies**.

- c. Under **OAuth policies**, in the **Permitted Users** drop-down list choose **Admin approved users are pre-authorized**.

Client Secret *********

Save Cancel

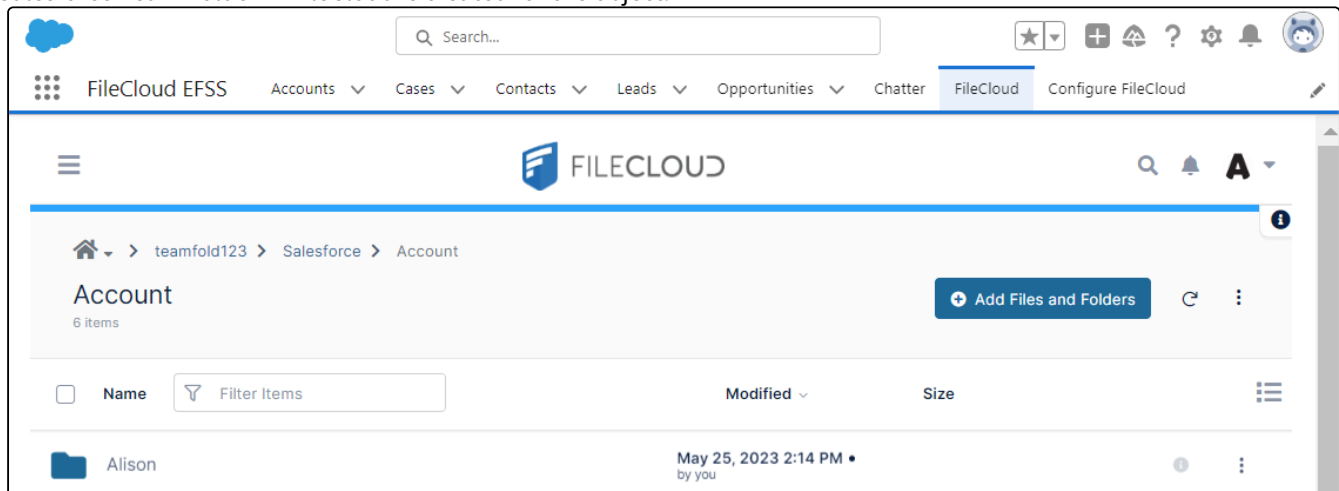

5. Click the **FileCloud** tab (to the left of **Configure FileCloud** tab).

FileCloud should load and allow you to log in.

Restricting Permissions on Salesforce Team Folders

Now that you have integrated FileCloud and Salesforce, when you create an object in Salesforce, a sub-folder in the Salesforce Team Folder in FileCloud is created for the object.

Since you may want more restrictive permissions on each object's folder when it is created, you can configure FileCloud to only enable the owner (creator) of the object and a group of users that you designate as managers to have access to the object folder.

To configure more restrictive default permissions on Team Folders for Salesforce objects:

1. If you have not already shared the Salesforce Team Folder with all FileCloud users or groups who may want to access an object sub-folder, give them access to the Salesforce Team Folder in FileCloud now.
2. Open the configuration file:
Windows: XAMPP DIRECTORY/htdocs/config/cloudconfig.php
Linux: /var/www/config/cloudconfig.php
3. Add the following lines, listing the emails of users who you want to be able to access all Salesforce object folders in the second setting:

```
define('TONIDOCLOUD_SALESFORCE_RESTRICT_ACCESS_ENABLED', '1');  
define('TONIDOCLOUD_SALESFORCE_MANAGER_USERS_EMAILS', ['email1@filecloud.com',  
'email2@filecloud.com']);
```

4. Save your changes.
Note: To turn off these restrictions, set TONIDOCLOUD_SALESFORCE_RESTRICT_ACCESS_ENABLED to 0.

SIEM Integration

Security information and event management (SIEM) products and services provide analysis of security alerts generated by applications and network hardware.

FileCloud can integrate its system alerts and auditing with external SIEM systems, enabling you to monitor all alerts and potential security issues in one place.

Open the SIEM settings page

To go to the SIEM settings page

1. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on the **Settings**

navigation page, click **Third Party Integrations**.

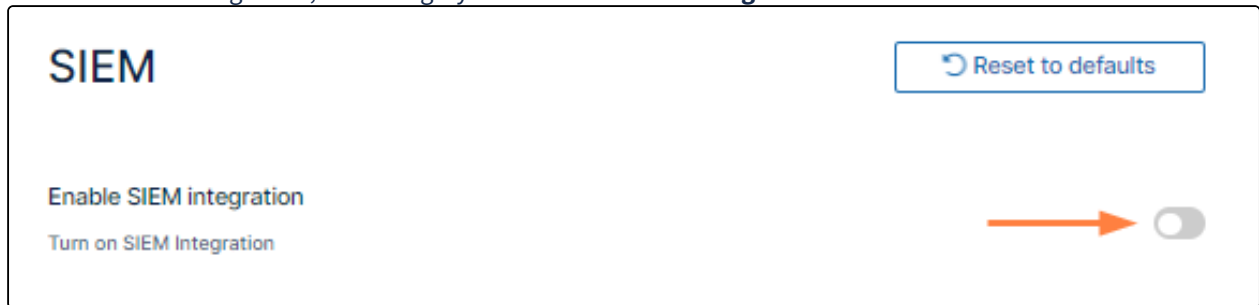

2. In the inner navigation bar on the left of the **Third Party Integrations** page, expand the **Third Party Integrations** menu, and click **SIEM**, as shown below.

The **SIEM** settings page opens.

Set up SIEM

1. To activate SIEM integration, click the grayed out **Enable SIEM integration** button.

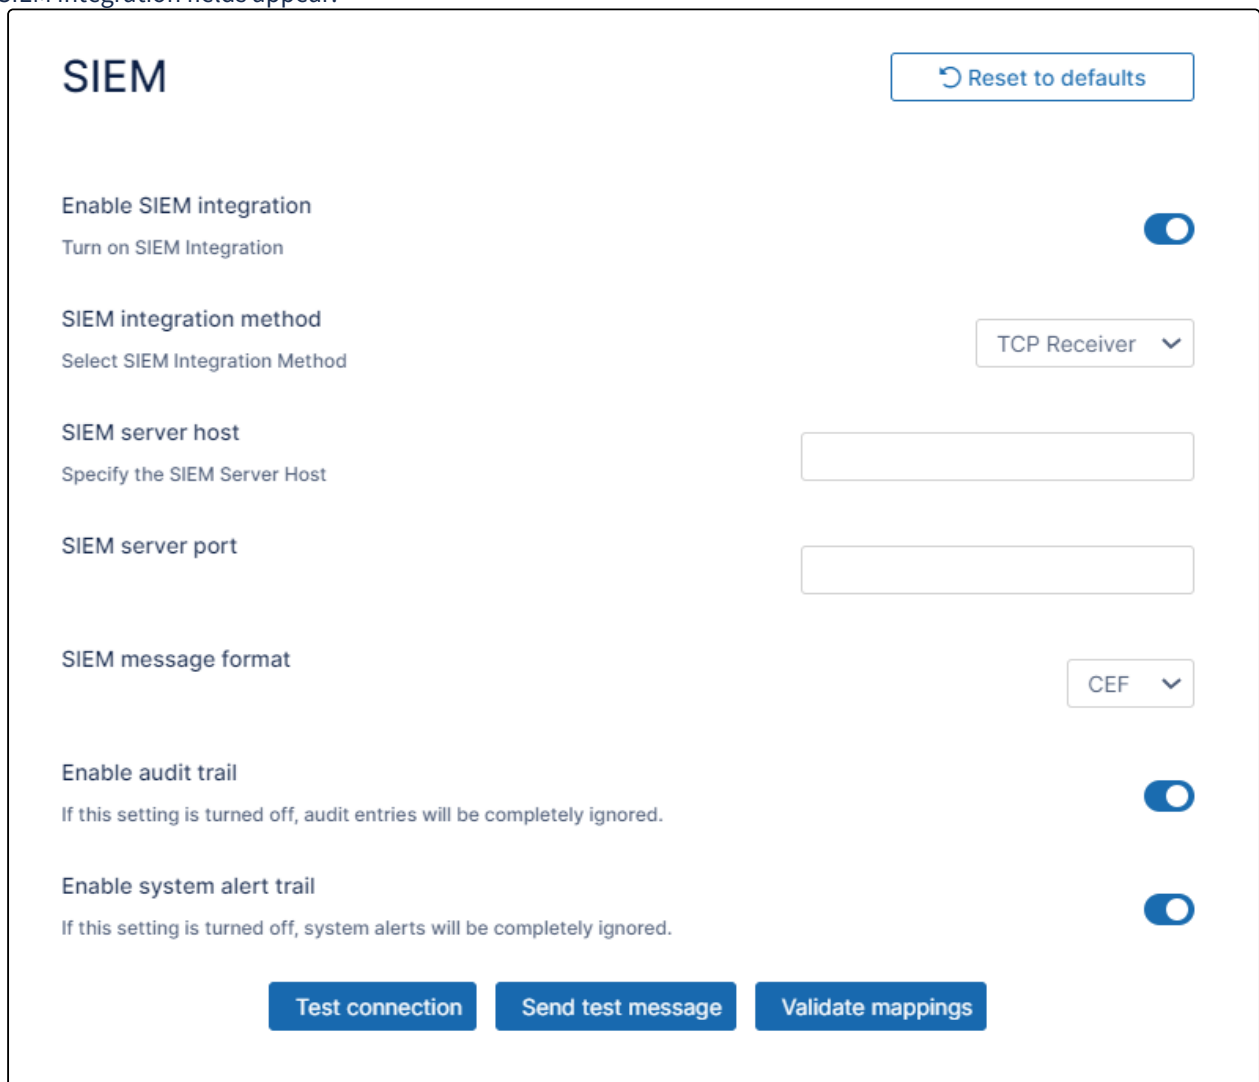

SIEM Reset to defaults

Enable SIEM integration
Turn on SIEM Integration

→

SIEM integration fields appear.

SIEM message format CEF ▼

Enable audit trail
If this setting is turned off, audit entries will be completely ignored. ☒

Enable system alert trail
If this setting is turned off, system alerts will be completely ignored. ☒

Test connection Send test message Validate mappings

2. Modify the settings using the information in the following table.

Option	Description
SIEM integration method	<p>Specifies the SIEM Integration method. Following options are available:</p> <ul style="list-style-type: none"> • TCP Receiver - messages are sent to the specified SIEM server endpoint (host and port) via TCP socket connection • UDP Receiver - messages are sent to the specified SIEM server endpoint (host and port) via UDP socket connection • Syslog - messages are written directly to the Syslog, which can be imported by the SIEM server <p>Note: SIEM software providers should specify supported integration methods in the SIEM documentation.</p>
SIEM server host (TCP and UDP integration only)	URL or IP Address of the SIEM server.
SIEM server port (TCP and UDP integration only)	Port exposed by the SIEM Server for the given socket connection.
SIEM message format	<p>Specifies the SIEM Message format. The following formats are available:</p> <ul style="list-style-type: none"> • CEF - Common Event Format • LEEF - Log Event Extended Format. <p>If you select LEEF the fields LEEF Version and LEEF Message Delimiter also appear:</p> <div data-bbox="678 1079 1468 1260"> </div> <p>NOTE: SIEM software provider should specify supported formats in the SIEM documentation.</p>
LEEF version (LEEF Format only)	<p>Specifies the version of the LEEF format message. Available versions:</p> <ul style="list-style-type: none"> • 1.0 • 2.0
LEEF message delimiter (LEEF Format only)	The delimiter to be used for LEEF messages. The options are whitespace and tab . Choose the option that is compatible with the SIEM tool you are using.
Enable audit trail	Specifies whether Audit records should be processed and send to the SIEM Server. Please check the Managing SIEM mappings section for more details.

Option	Description
Enable system alert trail	Specifies whether System Alerts generated within FileCloud should be processed and send to the SIEM Server. Please check the Managing SIEM mappings section for more details.
Test connection (TCP and UDP integration only)	Tests connection to the server specified by the Host and Port. NOTE: All settings have to be saved first. Connection tests are based on the currently saved settings.
Send test message	Sends a test message in the given format (CEF/LEEF) to the SIEM server specified by the Host and Port or saves a test message to the Syslog. NOTE: All settings have to be saved first. Connection tests are based on the currently saved settings.
Validate mappings	Validates all defined mappings. Please check the Managing SIEM mappings section for more details.

3. Click **Save**.

Syslog Integration

In order to provide more flexibility, FileCloud allows admins to specify two important Syslog parameters - ident and facility. **Ident** specifies the name of the application logged in Syslog. **Facility** specifies where all FileCloud messages are sent and can be utilized by the system level Syslog configuration (e.g. in "rsyslog"). Both settings can be overridden in the *cloudconfig.php* configuration file by inputting the following settings:

- Ident - to specify ident value, add the following setting to *cloudconfig.php*

```
define('TONIDOCLOUD_SIEM_SYSLOG_IDENT', 'IDENT_VALUE');
```

If no value is provided, by default it will be set to 'SIEM'.

- Facility -to specify ident value please add the following setting: to the *cloudconfig.php*

```
define('TONIDOCLOUD_SIEM_SYSLOG_FACILITY', LOG_LOCAL2);
```

If no value is provided, by default it will be set to LOG_LOCAL5. Below is a full list of supported values.

LOG_AUTH	Security/authorization messages (use LOG_AUTHPRIV instead in systems where that constant is defined)
LOG_AUTHPRIV	Security/authorization messages (private)

<code>LOG_CRON</code>	Clock daemon (cron and at)
<code>LOG_DAEMON</code>	Other system daemons
<code>LOG_KERN</code>	Kernel messages
<code>LOG_LOCAL0</code> ... <code>LOG_LOCAL7</code>	Reserved for local use. These are not available in Windows
<code>LOG_LPR</code>	Line printer subsystem
<code>LOG_MAIL</code>	Mail subsystem
<code>LOG_NEWS</code>	USENET news subsystem
<code>LOG_SYSLOG</code>	Messages generated internally by syslogd
<code>LOG_USER</code>	Generic user-level messages
<code>LOG_UUCP</code>	UUCP subsystem

LOG Values can also be seen in the [official PHP documentation](#).

Please note that there are no quotation marks used for LOG values, as these have to be set to one of the PHP constants.

Managing SIEM Mappings

The biggest challenge when working with the external SIEM servers is to map messages existing in the system to the correct CEF/LEEF format. In order to allow administrators to have full control of how to represent FileCloud's system alerts and audit records in the external SIEM system a special, flexible mapping syntax is supported.

1. Accessing SIEM mappings files

NOTE:

For this step you will need to access **WWWROOT**. It is typically located at:

Windows	Linux
c:\xampp\htdocs	/var/www/html

Create and access SIEM mappings files:

Navigate to the following directory:

WWWROOT/app/siem/maps

It contains the following files:

auditmap-sample.php
systemalertsmap-sample.php

which store mapping samples for audit and system alerts respectively.

Modify the mappings to correspond to your system, and save them as **auditmap.php** and **systemalertsmap.php**.

- **auditmap.php** enables FileCloud to convert audit entries to the valid SIEM messages.
- **systemalertsmap.php** enables FileCloud to convert FileCloud's system alerts to the valid SIEM messages.

NOTE: Mappings are stored in the .php file, so they have to follow all PHP syntax rules as well as the internal mappings rules and syntax. To validate all mappings please navigate to **Settings** → **Third Party Integrations** → **SIEM** and click the **Validate mappings** button.

 When you upgrade FileCloud, if you previously integrated with SIEM and already have auditmap.php and systemalertsmap.php files, you do not have to recreate or edit them unless you want to change existing mappings.

SIEM mapping format

A sample SIEM mapping is a PHP array entry, which itself is an array. It contains following fields:

id (Required) - identifies the SystemAlert/Audit entry this map refers to. **NOTE: It can be a string literal which matches the audit operation name or one of the SiemArea values available in FileCloud, an array of values or a wildcard '*' that specifies that the mapping is applied to ALL audit entries/system alerts.**

prefilter (Optional) - A collection of preconditions that event has to meet in order to be processed and sent to the SIEM system. It is an array of filters, where each filter has the following format: property => value, where:

- property is a valid property available for the Audit / System Alert record (TBD - add lists of properties)
- value is a value that has to be matched in order to process the Audit / System Alert record, i.e.

Sample System Alert Mappings

'prefilter' => [

```
'level' => SysAlert::SYSALERT_LEVEL_MELTDOWN
],
```

specifies that only System Alerts with the Meltdown criticality level would be sent to the SIEM server.

map (Required) - specifies the actual mapping between the FileCloud object being processed and the SIEM-formatted message that will be sent to the SIEM server. SIEM object as to contain the following four fields:

- **eventClass** - class of the event in the SIEM system.
- **eventName** - name of the event.
- **severity** - this is a SIEM side severity, which is a number from the 1-10 range.
- **extension** - a collection (array) of additional key value pairs that will be stored in the SIEM system (i.e. user that performed the action, ip address of the request, etc.). The key can be any arbitrary string.

To allow a very flexible way to resolve those mappings value a special 'language' was created. Values can be provided in any of the following ways:

- As a literal value (i.e. string or number), i.e.

Sample System Alert Mappings

```
'eventClass' => 'authentication',
'eventName' => 'invalid login',
'severity' => 3
```

- As a property binding that will resolve the value, based on the actual value provided by the FileCloud audit, system alert being processed:

Sample System Alert Mappings

```
'eventClass' => '$siemArea',
'eventName' => '$description',
'user' => '$username',
'ip' => '$ip'
```

Please check a full list of supported properties for more details. (TBD)

- As a method call:

Sample System Alert Mappings

```
'severity' => [[SiemConversionHelper::class, 'getSysAlertSeverity'],
['$level']],
```

NOTE: Users can create their own methods that can be utilized here. The first parameter is the PHP callback (class, method name) and the second parameter is the array of values (Optional) that will be processed by that callback. Parameters can be set to literal values or runtime-resolvable properties as described earlier. In FileCloud 19.2 *getSysAlertSeverity* is the only method available out of the box. It

converts internal System Alerts severity into the 1-10 range required by SIEM integration in the following way:

- Meltdown: 10
- Critical: 7
- Warning: 4
- Information: 1

Sample mappings

System Alerts:

Sample System Alert Mappings

```
//Report all meltdowns
$mappings[] = [
  'id' => '*', //Wildcard denotes all Alerts
  'prefilter' => [
    'level' => SysAlert::SYSALERT_LEVEL_MELTDOWN
  ],
  'map' => [
    'eventClass' => '$siemArea',
    'eventName' => '$description',
    'severity' => 10,
    'extension' => [
      'user' => '$username',
      'ip' => '$ip'
    ]
  ]
];

//AV system alert - infected file found
$mappings[] = [
  'id' => SiemArea::INFECTED_FILE,
  'map' => [
    'eventClass' => 'System Error',
    'eventName' => '$description',
    'severity' => [[SiemConversionHelper::class, 'getSysAlertSeverity'],
    ['$level']],
    'extension' => [
      'user' => '$username',
      'ip' => '$ip',
      'path' => '$alertContext.filePath',
      'file' => '$alertContext.fileName'
    ]
  ]
];

//Type mismatch report
$mappings[] = [
  'id' => SiemArea::INVALID_FILE_TYPE,
  'map' => [
```

```

        'eventClass' => 'System Error',
        'eventName' => '$description',
        'severity' => [[SiemConversionHelper::class, 'getSysAlertSeverity'],
        ['$level']],
        'extension' => [
            'user' => '$username',
            'ip' => '$ip',
            'path' => '$alertContext.file'
        ]
    ]
];

```

Audit:

```

//Report all audit events
$mappings[] = [
    'id' => '*',
    'prefilter' => [],
    'map' => [
        'eventClass' => '$operation',
        'eventName' => '$operation',
        'severity' => 2,
        'extension' => [
            'user' => '$userName',
            'userAgent' => '$userAgent',
            'ip' => '$ip',
            'notes' => '$notes'
        ]
    ]
];

//Failed login attempt
$mappings[] = [
    'id' => 'loginquest',
    'prefilter' => [
        //List of conditions that audit entry has to met in order to be processed
        (or filtered out if excluded option is there)
        'resultCode' => '0', //incidents only
        'exclude' => false// - optional 'include' is used by default
    ],
    'map' => [
        'eventClass' => 'login',
        'eventName' => 'Invalid login attempt',
        'severity' => 2,
        'extension' => [
            'user' => '$userName',
            'ip' => '$ip'
        ]
    ]
];

```

```
] ;
```

Managing SIEM Mappings

The biggest challenge when working with the external SIEM servers is to map messages existing in the system in the correct CEF/LEEF format. In order to allow administrators to have full control over how to represent FileCloud's System Alerts and Audit records in the external SIEM system a flexible mapping syntax is supported.

SIEM Mappings - general rules

Create and access SIEM mappings files

Access **WWWROOT**. It is typically located at:

Windows	Linux
c:\xampp\htdocs	/var/www/html

Navigate to the following directory:

WWWROOT/app/siem/maps

It contains the following files:

auditmap-sample.php
systemalertsmap-sample.php

These files store mappings for audit and system alerts.

Modify the mappings to correspond to your system, and save them as **auditmap.php** and **systemalertsmap.php**.

- **auditmap.php** enables FileCloud to convert audit entries to valid SIEM messages.
- **systemalertsmap.php** enables FileCloud to convert FileCloud's system alerts to valid SIEM messages.

i Mappings are stored in the .php file, so they have to follow all PHP syntax rules as well as internal mappings rules and syntax. To validate all mappings, navigate to **Settings > Third Party Integrations > SIEM** and click on **Validate mappings**.

SIEM mapping format

A sample SIEM mapping is a PHP array entry, which itself is an array. It contains the following fields:

id (required) - identifies the SystemAlert / Audit entry this map refers to.

Note that it can be a string literal that matches the audit operation name or one of the SiemArea values available in FileCloud, an array of values, or a wildcard '' that specifies that the mapping is applied to all audit entries/system alerts.*

prefilter (optional) - A collection of preconditions that an event has to meet in order to be processed and sent to the SIEM system. It is an array of filters, where each filter has the following format: property => value

where:

- property is a valid property available for the Audit/System Alert record
- value is a value that has to be matched in order to process the Audit / System Alert record, i.e.

Sample System Alert Mappings

```
'prefilter' => [
  'level' => SysAlert::SYSALERT_LEVEL_MELTDOWN
],
```

specifies that only System Alerts with the Meltdown criticality level would be sent to the SIEM server.

map (Required) - specifies the actual mapping between the FileCloud object being processed and the SIEM-formatted message that will be sent to the SIEM server. SIEM object to contain the following four fields:

- eventClass - class of the event in the SIEM system.
- eventName - The name of the event.
- severity - this is a SIEM side severity, which is a number from the 1-10 range.
- extension - a collection (array) of additional key-value pairs that will be stored in the SIEM system (i.e. the user that performed the action, IP address of the request, etc.). The key can be any arbitrary string.

To resolve mappings, provide values in any of the following ways:

- As a literal value (string or number)

Sample System Alert Mappings

```
'eventClass' => 'authentication',
'eventName' => 'invalid login',
'severity' => 3
```

- As a property binding that resolves the value with the actual value provided by the FileCloud audit system alert being processed:

Sample System Alert Mappings

```
'eventClass' => '$siemArea',
'eventName' => '$description',
'user' => '$username',
'filename' => '$request.filename', //Access a field in the request object/array
'filePath' => '$realpath > $request.path > $notes' //The filePath will be resolved
to the first non-empty value
```

```
'ip' => '$ip'
```

Properties should appear on the right-hand side of the arrow operator (=>). The property name must be prefixed with a dollar sign (\$). Properties can take one of the following values:

- A standalone value - '\$property'
- An array of values of an object with properties. The following syntax can be used to access any of the values: '\$array.field' or '\$object.field', for example, '\$request.filename'. This can be applied recursively if the internal field is also an array or object, for example, '\$response.meta.type'.
- As a chain of fallback properties ('\$property1 > \$property2.field > \$property3') - the value is resolved to the first non-empty property value. For example, the following syntax is resolved to filename if present or to the \$request.fname otherwise: 'fname' => '\$filename > \$request.fname'. This allows the admin to provide more generic rules.
- As a method call:

Sample System Alert Mappings

```
'severity' => [[SiemConversionHelper::class, 'getSysAlertSeverity'], ['$level']],
```

NOTE: Users can create and use their own methods here. The first parameter is the PHP callback (class, method name) and the second parameter is the array of values (optional) that is processed by that callback. Parameters can be set to literal values or runtime-resolvable properties as described earlier. In FileCloud 19.2 *getSysAlertSeverity* is the only method available out of the box. It assigns internal System Alerts a severity of 1-10 as required by SIEM integration in the following way:

- Meltdown: 10
- Critical: 7
- Warning: 4
- Information: 1

Shared properties

Properties listed below can be used in both System Alerts and Audit mappings.

Property	Description	Values
who	Author of the operation	Name of the user or process that has triggered the operation
ip	IP Address	A regular IPv4 address
ts	Operation timestamp	Timestamp

Audit mappings

Audit stores information about actions being performed within the system. Currently, audit stores information about 200+ unique operations being performed within FileCloud. Each Audit record contains some generic information, shared with the System Alerts properties (see [Shared Properties](#), above), common for each audit entry, and some unique properties, stored only for a group of actions.

Shared Audit Properties

Property	Description	Values
request	Request payload	<p>The full request payload provided as a collection of key-value pairs that can be extracted in the mapping. Each operation carries a unique request.</p> <p>The request can be mapped as a full object, and its info will be sent to the SIEM server as a string. For example: <code>`'request' => '\$request'`</code>, will be sent as <code>`{"op":"logginguest","userid":"john.doe","password":"xxx"}`</code></p> <p>Each field can also be sent individually if provided in the mapping: <code>`'loggedUser' => '\$request.userid'`</code>, where <code>`userid`</code> is one of the parameters of the request.</p>
response	Response payload	<p>Similar to the request, the response provides a collection of key-value pairs that can be extracted in the mapping or sent as a string.</p> <p>Each operation has a different response, so it is better to use this for dedicated rules.</p> <p>NOTE: Responses are not stored in audit by default, and they have to be enabled in Admin > Settings > Admin (Audit Settings section) > Audit Logging Level (FULL),</p> <p>This is not recommended for production as it may affect performance and usually is not needed for auditing.</p>
notes	Context of the operation	This field provides the most important information about each operation. The content is unique for each operation.
userAgent	The User-Agent that triggered the operation	NOTE: Web browser is used as a generic user-agent for all web browsers.
userName	Name of the user that triggered the operation	
operation	Name of the operation that was triggered	
resultCode	Result of the operation	<p>1 - the operation was performed successfully (for example, login attempt was successful, a file was deleted)</p> <p>0 - operation failed (for example, login was not possible, a file was not deleted due to invalid permissions)</p>

Property	Description	Values
recordId	A MongoDB id of the audit entry	This is a MongoDB ObjectId
hostname	A name of the host	The name of the current host. This allows SIEM to differentiate tenants.

Operation-specific Audit Properties

Property	Description	Values	Supported operations
auditArea	Provides information about the system area of the operation	Name of the system area	Currently only supported for operations from the following groups: <ul style="list-style-type: none"> workflows retention
serviceId	Additional information about the operation target	Carries additional information about the operations such as the name of the workflow or the id of the retention policy that was updated	Available only when the auditArea field is present
bandwidth	Information about the size of the file	File size in bytes	Available for the following operations: <ul style="list-style-type: none"> upload (file upload operation) downloadfile
realpath	File or folder realpath	FileCloud's original location of the file/folder, for example. / johndoe/document/internal/ doc.txt	Available only for retention-related and dlp operations

Property	Description	Values	Supported operations
metadata	A list of non-empty, custom attributes assigned to the file or folder	Any non-empty attributes assigned by the Custom metadata sets as a result of the Smart Classification rule	<p>The following operations are supported:</p> <ul style="list-style-type: none"> ▪ downloadfilemulti - Download multiple files ▪ downloadfile - Download single file ▪ getaudio - Play audio file ▪ getvideo - Play video file ▪ getfsslideimage - View image file ▪ docconvert - Open/view file ▪ quickshare - Quick share ▪ addusertoshare - Add specific users to share ▪ addgrouptoshare - Add specific groups to share ▪ setallowpublicaccess - Make share public (after sharing only with certain users/groups)
deviceInfo	Name of the client application	Name of the application, i.e. FileCloud Drive	Any operation that is performed by one of the client apps: Drive or Sync

Sample mappings

The following shows sample mappings for the most common operations:

```

/***** Downloads *****/
// Download file
$mappings[] = [
  'id' => 'downloadfile',
  'prefilter' => [],
  'map' => [
    'eventClass' => 'FileOperations',
    'eventName' => '$operation',
    'severity' => 2,
    'extension' => [
      'suser' => '$userName',
      'shost' => '$hostname', // name of the host
      'recordId' => '$recordId', // Audit record id
      'requestClientApplication' => '$userAgent',
      'src' => '$ip',
      'fname' => '$request.filename > $notes', // $notes is a fallback for
downloadfilemulti operation

```

```

        'filePath' => '$realpath > $request.filePath', // realpath is used for
downloadfilemulti
        'fsize' => '$bandwidth',
        'cs1' => '$metadata',
        'cs1Label' => 'Metadata assigned to the file'

System Alert mappings

FileCloud allows admins to create mappings for System Alerts generated by the system due to unexpected or unwanted behaviors. System Alert mappings contain properties that can be sent to the SIEM server or logged in the syslog for further processing.

Supported properties

Property	Description	Values
siemArea	System area where the alert was raised	One of the following values: SiemArea::INFECTED_FILE SiemArea::INVALID_FILE_TYPE SiemArea::AV_CHECK_FAILED SiemArea::UNHANDLED_EXCEPTION SiemArea::SYSTEM_ERROR SiemArea::DISK_SPACE_EXCEEDED SiemArea::INDEX_DB_FAILURE SiemArea::RMC_INVALID_POLICY SiemArea::SEND_EMAIL_FAILED SiemArea::BACKGROUNDING_FAILED SiemArea::METADATA_HEALTH_CHECK SiemArea::WORKFLOW SiemArea::ZIP_BACKUP_FAILURE SiemArea::SIEM_SERVER_CONNECTION SiemArea::DLP_SHARE_KILL
level	System alert critical level	One of the following values: SysAlert::SYSALERT_LEVEL_MELTDOWN SysAlert::SYSALERT_LEVEL_CRITICAL SysAlert::SYSALERT_LEVEL_WARNING SysAlert::SYSALERT_LEVEL_INFORMATION

Property	Description	Values
type	Type of system alert	<p>One of the following values:</p> <pre> SysAlert::SYSALERT_TYPE_DLP_SHARE_KILL_FAILED SysAlert::SYSALERT_TYPE_DLP_SHARE_KILLED SysAlert::SYSALERT_TYPE_CODE_CONFIGURATION_ERROR SysAlert::SYSALERT_TYPE_CODE_AV_FAILURE SysAlert::SYSALERT_TYPE_CODE_SIGNATURE_FAILURE SysAlert::SYSALERT_TYPE_CODE_EXCEPTION SysAlert::SYSALERT_TYPE_CODE_ERROR SysAlert::SYSALERT_TYPE_QUOTA_EXCEEDED </pre>
description	Alert description	
notes	Alert notes	
username	The user whose actions raised the alert	
alertContext	Additional information, related to the alert	<p>Various contexts, depending on the Alert.</p> <p>For example:</p> <p>file - filename for the File version deletion operation</p> <p>filePath - file location for the Infected file</p> <p>fileName - file name for the Infected file</p>

Sample mappings

Sample System Alert Mappings

```

//Report all meltdowns
$mappings[] = [
  'id' => '*', //Wildcard denotes all Alerts
  'prefilter' => [
    'level' => SysAlert::SYSALERT_LEVEL_MELTDOWN
  ],
  'map' => [
    'eventClass' => '$siemArea',
    'eventName' => '$description',
    'severity' => 10,

```

```

        'extension' => [
            'user' => '$username',
            'ip' => '$ip'
        ]
    ]
};

//AV system alert - infected file found
$mappings[] = [
    'id' => SiemArea::INFECTED_FILE,
    'map' => [
        'eventClass' => 'System Error',
        'eventName' => '$description',
        'severity' => [[SiemConversionHelper::class, 'getSysAlertSeverity'],
['$level']],
        'extension' => [
            'user' => '$username',
            'ip' => '$ip',
            'path' => '$alertContext.filePath',
            'file' => '$alertContext.fileName'
        ]
    ]
];

//Type mismatch report
$mappings[] = [
    'id' => SiemArea::INVALID_FILE_TYPE,
    'map' => [
        'eventClass' => 'System Error',
        'eventName' => '$description',
        'severity' => [[SiemConversionHelper::class, 'getSysAlertSeverity'],
['$level']],
        'extension' => [
            'user' => '$username',
            'ip' => '$ip',
            'path' => '$alertContext.file'
        ]
    ]
];

```

SIEM Integration with Splunk Enterprise

You can set up FileCloud's SIEM Integration feature with your Splunk server to receive audit logs and send event alerts to the administrator's email.

Splunk Server Configuration

To configure Splunk server to receive data inputs from FileCloud through a designated TCP port and a specified source type, create a TCP Data Input entry that specifies the port that receives messages from the FileCloud and create a custom source type for FileCloud..

1. Log in to Splunk.
2. Click **Add Data**.
3. In the **TCP** row, click **Add new**.
An **Add Data** wizard opens.
4. In the **Select Source** screen, in **Port**, enter the port that will receive messages from FileCloud.
In **Source name override**, enter a name for the FileCloud server.

Local Event Logs
Collect event logs from this machine.

Remote Event Logs
Collect event logs from remote hosts. Note: this uses WMI and requires a domain account.

Files & Directories
Upload a file, index a local file, or monitor an entire directory.

HTTP Event Collector
Configure tokens that clients can use to send data over HTTP or HTTPS.

TCP / UDP
Configure the Splunk platform to listen on a network port.

Configure this instance to listen on any TCP or UDP port to capture data sent over the network (such as syslog). [Learn More](#)

TCP **UDP**

Port ? 8889
Example: 514

Source name override ? FileCloud Test Server
host:port

Only accept connection from ? optional
example: 10.1.2.3, lbadhost.splunk.com, *.splunk.com

5. Go to the next screen.
6. In the **Input Settings** screen, enter the following settings:
 - Click **New**.
 - In **Source Type**, enter **FileCloud**.
 - In **Source Type Category**, choose **Custom**.
 - In **Source Type Description**, enter **FileCloud Audit Logs**.
 - In **App Context**, choose **Apps Browser (appsbrowser)**.
 - For **Host**, choose one of the following:
 - **IP** - Uses IP address of the host where the event originated.
 - **DNS** - Uses Domain Name Services (DNS) to convert the IP address to a host name that events are tagged with.
 - **Custom** - When you click this option, a **Host field value** field appears. This option uses the value you enter in **Host field value** to tag events.

- Set **Index** to **Default**.

Input Settings

Optionally set additional input parameters for this data input as follows:

Source type

The source type is one of the default fields that the Splunk platform assigns to all incoming data. It tells the Splunk platform what kind of data you've got, so that the Splunk platform can format the data intelligently during indexing. And it's a way to categorize your data, so that you can search it easily.

Select New

Source Type

FileCloud

Source Type Category

Custom ▼

Source Type Description

FileCloud Audit Logs

App context

Application contexts are folders within a Splunk platform instance that contain configurations for a specific use case or domain of data. App contexts improve manageability of input and source type definitions. The Splunk platform loads all app contexts based on precedence rules. [Learn More](#)

App Context

Apps Browser (appsbrowser) ▼

Host

When the Splunk platform indexes data, each event receives a "host" value. The host value should be the name of the machine from which the event originates. The type of input you choose determines the available configuration options. [Learn More](#)

Method ?

IP DNS Custom

7. Go to the next screen in the wizard, **Review**, and check your settings.
8. Click next to complete your TCP Data Input entry configuration.

Setting up FileCloud to connect to the Splunk Server

Once the TCP Data Input entry is configured in Splunk, configure the SIEM Integration settings in FileCloud.

1. Go to the **SIEM** settings page.

To go to the SIEM settings page

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on the **Settings** navigation page, click **Third Party Integrations** .
- b. In the inner navigation bar on the left of the **Third Party Integrations** page, expand the **Third Party Integrations** menu, and click **SIEM**, as shown below.

The **SIEM** settings page opens.

- To activate SIEM integration, click the grayed out **Enable SIEM integration** button.

SIEM integration fields appear.

- In **SIEM Integration Method**, choose **TCP Receiver**.

In **SIEM Server Host**, enter the IP address or the hostname of the Splunk server.

In **SIEM Server Port**, you may enter a unique port that is not currently used by the Splunk server for sending messages.

For the other settings, see [SIEM Integration](#).

SIEM

Enable SIEM integration

Turn on SIEM Integration

SIEM integration method

Select SIEM Integration Method

TCP Receiver

SIEM server host

Specify the SIEM Server Host

19.0.2.0

SIEM server port

24

4. Validate your configuration by clicking the **Test Connection**, **Send Test Message**, and **Validate Mappings** buttons. The **Send Test Message** button should send a test connection to the Splunk server, for example:

NOTE: Additional fields can be added by modifying the mappings from the **auditmap.php** and **systemalertsmap.php** files in FileCloud. See [Managing SIEM Mappings](#) for more information.

Setting up FileCloud event alerts in Splunk

1. Run a search for the event type from the Splunk Search screen and confirm that you get the expected data from the results.

2. In the upper-right corner, in the **Save As** drop-down list choose **Alert**:

The screenshot shows the 'New Search' interface. At the top right, there is a 'Save As' dropdown menu. The 'Alert' option is highlighted. Below the 'Save As' menu, there is a search bar with the text 'Invalid login attempt'. Below the search bar, there is a table of events. The table has columns for 'Time' and 'Event'. The events are listed in a table with alternating light and dark rows. The first event is at 9/28/22 3:28:40.000 AM, and the last event is at 9/9/22 10:00:01.000 PM. The table is titled 'Events (10)' and has a 'Format' dropdown set to 'Timeline'. There are also buttons for 'Zoom Out', 'Zoom to Selection', and 'Deselect'. On the left side, there is a 'Hide Fields' section with a list of fields: 'recordid', 'host', 'source', 'sourcetype', 'index', 'ip', 'linecount', 'punct', 'samplehost', 'splunk_server', 'timestamp', and 'user'. There is also a '+ Extract New Fields' button.

The **Save As Alert** dialog box opens.

3. Fill in the fields. Enter the following fields as indicated:

- **Alert Type** - Choose **Scheduled** to search for alert events on a schedule. Choose **Real-time** to trigger an alert when an alert event occurs.
If you choose **Scheduled**, also choose a frequency in the drop-list below it.
- **Trigger alert when** - Choose **Number of Results**, and enter a number.
- In **Trigger Actions**, click **Add Actions**, and choose **Send email** as the action that is triggered by an alert.
- In **To**, enter the recipient of the email.

4. Click **Save**.

reCaptcha Settings

FileCloud supports reCaptcha v2. When you enable reCaptcha integration, reCaptcha is applied when users log in to FileCloud and when they access a password-protected file or folder share.

To configure reCaptcha:

1. Register your site at <https://developers.google.com/recaptcha> and get a key pair.
2. Open the ReCAPTCHA settings page.

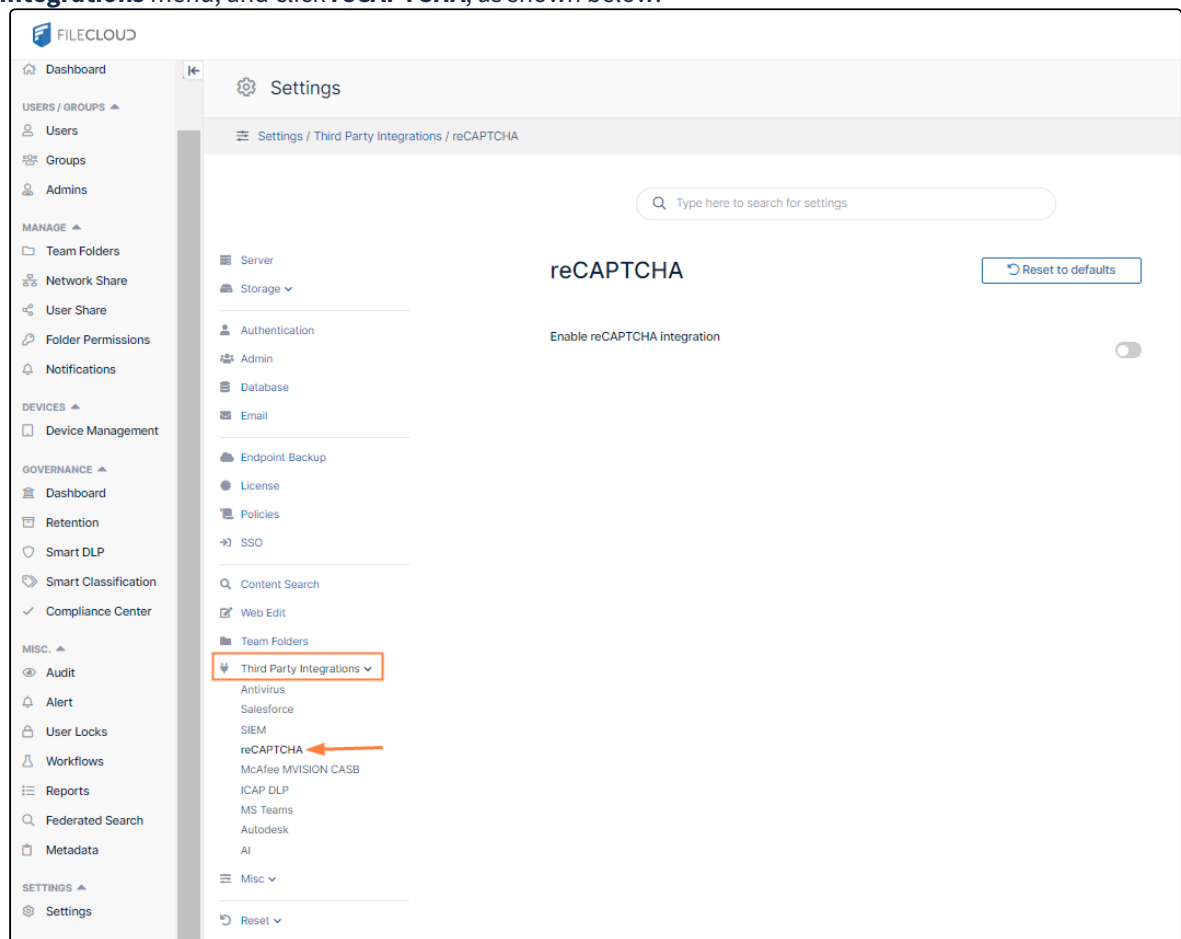

To go to the reCAPTCHA settings page

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on the **Settings**

navigation page, click **Third Party Integrations**.

- b. In the inner navigation bar on the left of the **Third Party Integrations** page, expand the **Third Party Integrations** menu, and click **reCAPTCHA**, as shown below.

The **reCAPTCHA** settings page opens.

Open the **reCAPTCHA** settings page.

3. Enable the setting **Enable reCAPTCHA integration**.
Additional reCAPTCHA settings appear.

4. If you plan to use a non-default reCAPTCHA site, enter the site hostname into **reCAPTCHA Host Name** in the format `www.hostname.com`.

Note: If you are in a location that cannot access [www.google.com](https://developers.google.com/recaptcha/docs/faq#can-i-use-recaptcha-globally), enter **www.recaptcha.net** (<https://developers.google.com/recaptcha/docs/faq#can-i-use-recaptcha-globally>)

5. Enter your key pair into **reCAPTCHA Site Key** and **reCAPTCHA Secret**.

SSO API: Configure Import of SSO Groups and Users

i Beginning in FileCloud 23.251, admins can import FileCloud groups and users from Okta, Google, and Azure SSO providers. In the future, importing groups and users from additional providers may be available.

Systems that authenticate users with Okta, Google, or Azure SSO can also import the users and their groups from the SSO provider. This requires integration of FileCloud and the SSO provider, separate from the configuration of the SSO provider(s) on the SSO settings page or through the idpconfig file.

To set up the integration of the SSO provider and FileCloud for group and user import:

- Step 1: Set up FileCloud to integrate with the SSO provider for group/user import in the SSO provider's application.
- Step 2: Set up the SSO provider to integrate with FileCloud for group/user import in the FileCloud admin portal.

Step 1: Set up FileCloud to integrate with the SSO provider in the SSO provider's application:

Currently, the SSO providers available for integration with FileCloud for group/user import are Okta, Google, and Azure.

- [Okta: Set Up FileCloud Integration for SSO Group/User Import](#)
- [Azure: Set up FileCloud Integration for SSO Group/User Import](#)
- [Google: Set up FileCloud Integration for SSO Group/User Import.](#)

Step 2: Set up the SSO provider for importing groups and users into FileCloud:

1. Open the **SSO API** page.

To go to the SSO API page:

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on

the **Settings** navigation page, click **Third Party Integrations** .

- b. In the inner navigation bar on the left of the **Third Party Integrations** page, expand the **Third Party Integrations** menu, and click **SSO API**, as shown below.

The screenshot shows the FileCloud Server Settings interface. The left sidebar contains a navigation menu with categories like MANAGE, DEVICES, GOVERNANCE, MISC, SETTINGS, and CUSTOMIZATION. The 'Third Party Integrations' option is highlighted. The main content area is titled 'SSO API' and includes a search bar, a 'Reset to defaults' button, and a 'Group Sync Interval' field set to 86400. Below this is a section for 'New SSO Provider Integration' with an 'Add Integration' button and a table listing existing integrations.

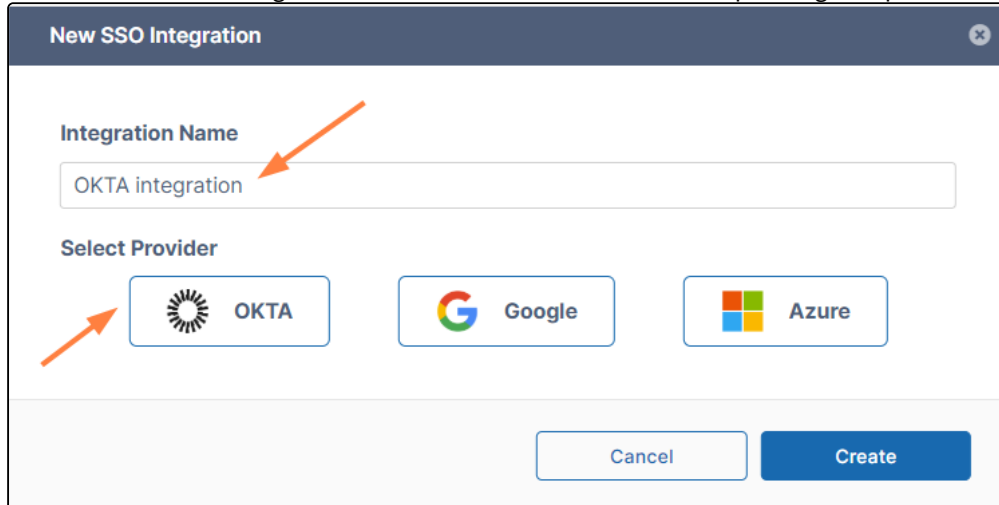

Integration Name	Integration Provider	Provider Domain	Actions
okta sso	okta	dev-92791588.okta.com	Edit Refresh Delete
test-azure	azure	70dbf572-2e9b-4792-b146-0b8944bfe4	Edit Refresh Delete

The SSO API settings page opens.

This is a zoomed-in view of the SSO API settings page. It shows the 'SSO API' title, a 'Reset to defaults' button, and the 'Group Sync Interval' field set to 86400. Below this is the 'New SSO Provider Integration' section with an 'Add Integration' button.

- By default, the group sync is set to occur every 86400 seconds (once a day). To change how often group sync occurs, modify the value of **Group Sync Interval**. Specify the value in seconds.
- Click **Add Integration**. The **New SSO Integration** dialog box opens.

4. Enter a name for the integration and click the button for the corresponding SSO provider:

The dialog box titled "New SSO Integration" contains the following elements:

- Integration Name:** A text input field containing "OKTA integration". An orange arrow points to this field.
- Select Provider:** A section with three buttons: "OKTA" (with a sun icon), "Google" (with the Google logo), and "Azure" (with the Azure logo). An orange arrow points to the "OKTA" button.
- Buttons:** "Cancel" and "Create" buttons at the bottom right.

The dialog box expands.

5. Enter the integration values for the specific SSO provider:

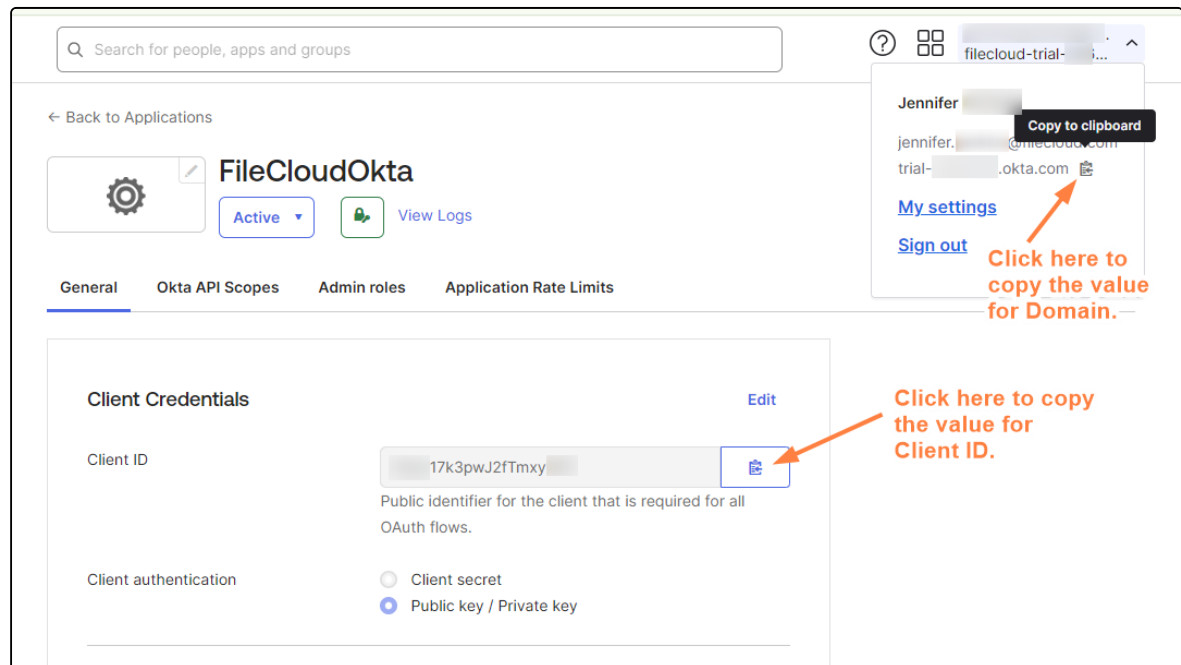

OKTA

Enter integration values for Okta

- a. When you click the **OKTA** button under **Select Provider**, the following settings appear. Enter the value for each as indicated in the table below.

Integration Name	You may enter any name.
Client ID	Enter the Client ID created for you when you set up the integration with FileCloud in Okta . You may copy it from the Okta Admin Console's listing for the application and paste it into the field. The following image shows where it appears in the Okta Admin Console.
Private key file	Choose the .pem file that you saved your private key in. You may have created the file and saved it when you were setting up the integration with FileCloud in Okta .

Domain	Enter the domain that Okta created for your user in Okta when you set up the integration with FileCloud in Okta . You may copy it from the Okta Admin Console's User drop-down box and paste it into the field. The following image shows where it appears in the Okta Admin Console.
IdP endpoint URL or entity ID (Optional)	Enter if you are using multiple IdP's. Enter the value in the field IdP endpoint URL or entity ID from the FileCloud SSO settings.

Credentials enable confidential applications to identify themselves to the authentication service when receiving tokens at a web addressable location (using an HTTPS scheme). For a higher level of assurance, we recommend using a certificate (instead of a client secret) as a credential.

Application registration certificates, secrets and federated credentials can be found in the tabs below.

Certificates (0) **Client secrets (1)** Federated credentials (0)

A secret string that the application uses to prove its identity when requesting a token. Also can be referred to as application password.

+ New client secret

Description	Expires	Value	Secret ID
AzureFileCloud	12/20/2025	5uw*****	-1498-402a...

Copy the value here and paste it into Client Secret.

Okta: Set Up FileCloud Integration for SSO Group/User Import

To configure FileCloud/Okta integration in Okta for SSO group/user import:

1. Log in to the Okta admin portal, and navigate to **Applications > Applications**.
2. Click **Create App Integration**.

A list of sign-in methods opens.

3. Choose **API Services**, and click **Next**.

Create a new app integration

Sign-in method

[Learn More](#)

☐ OIDC - OpenID Connect

Token-based OAuth 2.0 authentication for Single Sign-On (SSO) through API endpoints. Recommended if you intend to build a custom app integration with the Okta Sign-In Widget.

☐ SAML 2.0

XML-based open standard for SSO. Use if the Identity Provider for your application only supports SAML.

☐ SWA - Secure Web Authentication

Okta-specific SSO method. Use if your application doesn't support OIDC or SAML.

☒ API Services

Interact with Okta APIs using the scoped OAuth 2.0 access tokens for machine-to-machine authentication.

You have finished setting up integration on the Okta side.

Now you have the values you need to set up integration on the FileCloud side: the domain in the user drop-down box, the **Client ID** on the General tab, and the .pem keyfile that you saved.

The screenshot displays the Okta Admin Console interface for the 'FileCloudOkta' application. At the top, there is a search bar and a navigation menu with options like 'Back to Applications', 'Active', and 'View Logs'. The main content area is divided into sections: 'Client Credentials' and 'PUBLIC KEYS'. In the 'Client Credentials' section, the 'Client ID' is shown as '17k3pwJ2fTmxyt' and is highlighted with an orange box. Below it, the 'Client authentication' section shows 'Public key / Private key' as the selected option. In the 'PUBLIC KEYS' section, there is a table with one row containing a key ID 'logQ', a key value 'ipgveWhp3I812BRF-dxOr9f2Tu0T-', and an 'Active' status. A red arrow points to the 'Add' button in the 'PUBLIC KEYS' section, with a text overlay 'Saved as your Private key file (pem)'.

4. In the left navigation pane, go to **Manage > API permissions**, and then click **Add a permission**.

The screenshot shows the Microsoft Azure portal interface. In the left-hand navigation pane, the 'Manage' section is expanded, and 'API permissions' is selected. The main content area displays the 'API permissions' page for 'AzureFileCloud Integration'. It includes a search bar, a refresh button, and a 'Got feedback?' link. Below this, there are two informational banners. The first banner states: 'Granting tenant-wide consent may revoke permissions that have already been granted tenant-wide for that application. Permissions that users have a behalf aren't affected. [Learn more](#)'. The second banner states: 'The "Admin consent required" column shows the default value for an organization. However, user consent can be customized per permission, user, or reflect the value in your organization, or in organizations where this app will be used. [Learn more](#)'. The 'Configured permissions' section explains that applications are authorized to call APIs when granted permissions by users/admins. It includes a link to 'Learn more about permissions and consent'. Below this, there is a '+ Add a permission' button and a checkbox for 'Grant admin consent for FileCloud'. A table titled 'API / Permissions name' lists the configured permissions for 'Microsoft Graph (1)'. The table has columns for 'API / Permissions name', 'Type', 'Description', 'Admin consent required', and 'Status'. The listed permission is 'User.Read' with a 'Delegated' type and the description 'Sign in and read user profile'. The 'Admin consent required' is 'No'.

API / Permissions name	Type	Description	Admin consent required	Status
Microsoft Graph (1)				
User.Read	Delegated	Sign in and read user profile	No	

5. In the **Request API permissions** box, click **Microsoft Graph**.

The screenshot shows the 'Request API permissions' dialog box in the Microsoft Azure portal. The 'Microsoft APIs' tab is selected. Under the 'Commonly used Microsoft APIs' section, 'Microsoft Graph' is highlighted with an orange arrow. The description for 'Microsoft Graph' is: 'Take advantage of the tremendous amount of data in Office 365, Enterprise Mobility + Security, and Windows 10. Access Microsoft Entra ID, Excel, Intune, Outlook/Exchange, OneDrive, OneNote, SharePoint, Planner, and more through a single endpoint.' Other APIs listed include 'Azure Communication Services', 'Azure DevOps', 'Azure Key Vault', and 'Azure Rights Management'.

In the **Request API Permissions** box, you are prompted to choose a type of permission.

6. First, select **Delegated permissions**, and request the permissions specified below.

Request API permissions

[← All APIs](#)

 **Microsoft Graph**
<https://graph.microsoft.com/> [Docs](#) [↗](#)

What type of permissions does your application require?

Delegated permissions
Your application needs to access the API as the signed-in user.

Application permissions
Your application runs as a background service or daemon without a signed-in user.

Delegated permissions to request:

- Directory.Read.All
- Group.Read.All
- GroupMember.Read.All
- User.Read
- User.Read.All

7. Search for the permission type in the Select permissions search bar to find it more quickly, and then check the permissions.

8. When you are done checking all of the above permissions, click **Add permissions**.

Request API permissions

15. Click **SAVE**.

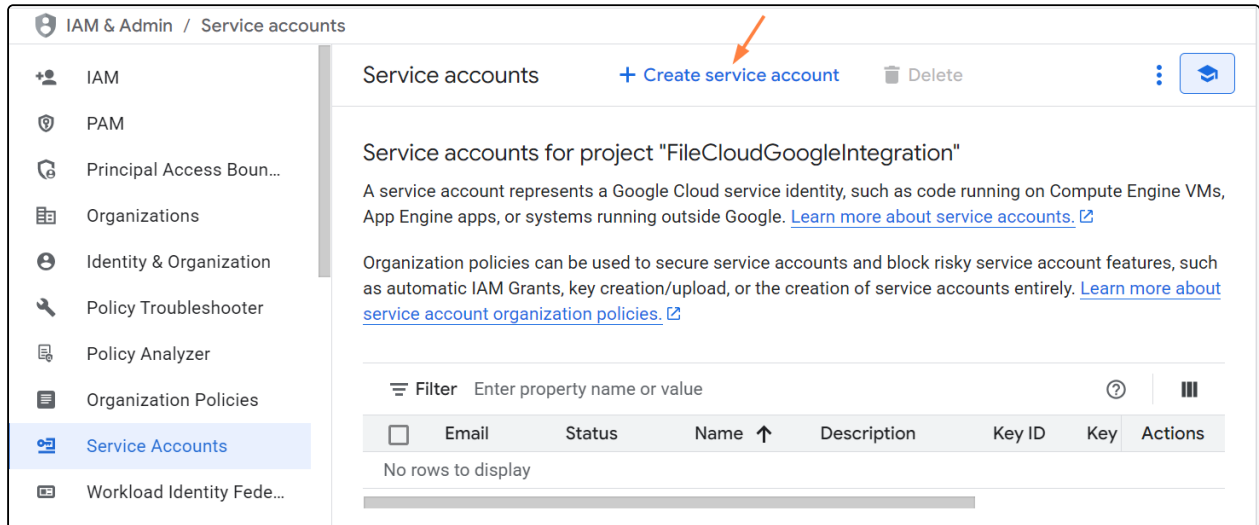

Now, create a key file and grant OAuth scopes.

Create a key file and grant FileCloud access to Google

Using your superadmin account, create a service account that grants FileCloud the necessary access to the Google api for SSO authentication. If you do not have a superadmin account, have a superadmin perform the following steps for you.

To create the service account:

1. Log in to <https://console.cloud.google.com/iam-admin/serviceaccounts>.
2. Select your project, or create a new one.

3. Click **Create service account**.4. Enter a **Service account name** and click **Create and continue**.

The screenshot shows the 'Create service account' form. It has a back arrow and the title 'Create service account'. The first step is '1 Create service account'. The form contains the following fields and elements:

- Service account name**: A text input field containing 'FilecloudGoogle', with an orange arrow pointing to it.
- Display name for this service account**: A label below the name field.
- Service account ID ***: A text input field containing 'filecloudgoogle'.
- Email address**: A label showing 'filecloudgoogle@noted-tempo-463517-s0.iam.gserviceaccount.com' with a copy icon.
- Service account description**: A text input field.
- Create and continue**: A blue button at the bottom, highlighted with an orange arrow.

5. Continue through the **Permissions** and the **Principals with access** sections without entering any values, and click **Done**.

The service account is saved.

To enter the integration values into the FileCloud side, see SSO API: Configure Import of SSO Groups and Users.

CASB integration

⚠ For security purposes, to initially access the API, you must now change the default API key. If you do not change it, when you enter a command to call the API, an error is returned.
Note: You are only required to change the default API key initially; after that, you can continue to use the new key you entered.

FileCloud includes a smart data leak prevention (DLP) functionality that monitors user actions and prevents them if they pose a security risk.

In Version 20.2, FileCloud has added integration with external cloud access security broker (CASB) software to enable you to expand your DLP monitoring and risk prevention. This enables you to expand activity monitoring and measures taken when there is a possible security breach.

Currently, FileCloud supports integration with McAfee CASB software.

To enable CASB integration with FileCloud:

1. Open the McAfee MVISION CASB settings page.

To go to the McAfee MVISION CASB settings page

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on

the Settings navigation page, click Third Party Integrations .

- b. In the inner navigation bar on the left of the Third Party Integrations page, expand the **Third Party Integrations** menu, and click **McAfee MVISION CASB**, as shown below.

2. Check **Enable FileCloud CASB** Integration.
The field **FileCloud CASB API Key** appears.

3. Change the value of **FileCloud CASB API key** to any alphanumeric string.
4. Click **Save**.
5. Add the value of the **FileCloud CASB API key** to McAfee MVISION CASB. See [McAfee's product documentation](#) for instructions.

[McAfee CASB integration](#)

McAfee CASB integration

Beginning with version 20.2, FileCloud supports integration with McAfee CASB.

This enables you to use McAfee CASB to apply extensive DLP rules when monitoring user events such as actions on files and folders and logins to the system. If a CASB DLP rule is violated, McAfee takes actions such as notifying a user, deleting a file, or removing a share.

For example, you could set up McAfee CASB to monitor the content of files when they are shared in a public FileCloud folder.

McAfee CASB supported features

User Activity	File Upload, File Update, File Download, File has been Shared publicly, Folder has been shared publicly
	User logged in
DLP Features	Content- aware Public Shared Link, or Pure Public Shared link Policy evaluation for Item Shared event
	Content-ware Policy evaluation for File Upload/Update event
	Response Actions: Incident Remove Shared link Email notification Send user notification Delete

FileCloud events and McAfee responses

To receive information about events, McAfee registers a webhook with FileCloud, which enables FileCloud to push information about events as they occur to McAfee CASB.

FileCloud pushes information to McAfee when a user performs one of the following actions:

- adds a file
- updates a file
- adds an external file
- downloads a file
- logs in successfully
- creates a share
- creates an account
- deletes an account

McAfee responds to events that may compromise security using FileCloud's API. FileCloud's API includes the following endpoints:

- register
- deregister

- getwebhook
- downloadfile
- upload
- deletefile
- getshareinformation
- removeuserfromshare
- removegroupfromshare
- deleteshare
- getuserinformation

For more information about using these APIs, see the API documentation at <https://fcapi.getfilecloud.com/>

ICAP DLP

i The ability to configure ICAP DLP as a provider for FileCloud's CCE is available in Version 20.3 and higher.

ICAP DLP has been added as a provider for FileCloud's Smart Classification (CCE), enabling you set up a content classification rule that flags files for blocking or deletion by DLP rules. You must configure it as a third-party provider in FileCloud to use it with the CCE.

What is ICAP?

ICAP is a generic protocol that allows web servers to offload specialized tasks to custom-built servers. Examples of such specialized tasks include DLP (data loss prevention) based content scanning, URL filtering and antivirus scanning.

Integrating ICAP DLP with FileCloud

1. Open the ICAP DLP settings page.

To go to the ICAP DLP settings page

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on

the Settings navigation page, click Third Party Integrations

- b. In the inner navigation bar on the left of the Third Party Integrations page, expand the **Third Party Integrations** menu, and click **ICAP DLP** as shown below.

The screenshot shows the FileCloud Server Settings interface. On the left is a sidebar with various categories: Admins, MANAGE (Team Folders, Network Share, User Share, Folder Permissions, Notifications), DEVICES (Device Management), GOVERNANCE (Dashboard, Retention, Smart DLP, Smart Classification, Compliance Center), MISC. (Audit, Alert, User Locks, Workflows, Reports, Federated Search, Metadata, Quarantined files), SETTINGS (Settings), CUSTOMIZATION (Customization), and SYSTEM. The 'Settings' option is selected. The main content area is titled 'Settings' and 'Third Party Integrations / ICAP DLP'. It features a search bar and a 'Reset to defaults' button. The 'ICAP DLP' section includes the following settings:

- Server local IP**: Must not be 127.0.0.1. Input field.
- ICAP remote hostname**: Input field.
- ICAP port**: Typically 1344 for regular ICAP or 11344 for secure ICAP. Input field.
- Secure ICAP**: Enable if the ICAP server is running with SSL or TLS protocols. Toggle switch.
- File size limit**: Files larger than this size will not be scanned. Units: 0 Bytes.
- ICAP service name**: Enter the name of the ICAP server provided for this ICAP service. Input field.

In the left sidebar, the 'Third Party Integrations' menu is expanded, and 'ICAP DLP' is highlighted with an orange arrow.

2. Fill in the fields. See the table below for information.

ICAP DLP

[Reset to defaults](#)

Files larger than this size will not be scanned.

ICAP service name

Enter the name of the ICAP server provided for this ICAP service.

reqmod

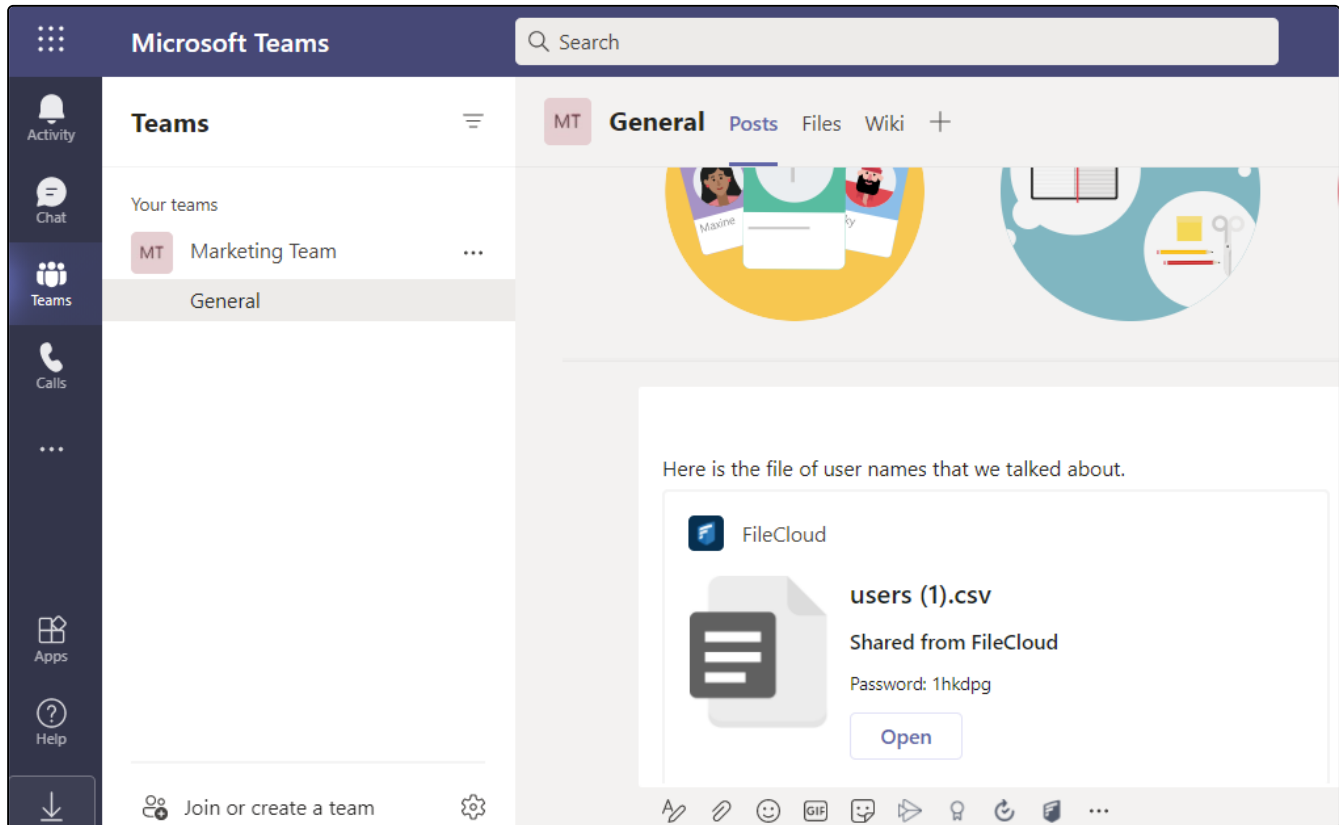

Setting	Description
Server Local IP	In most cases, enter the value 0.0.0.0 . If you are using a separate FileCloud policy with ICAP, enter the Private (LAN) IP of the FileCloud server.
ICAP Remote Hostname	Enter the hostname or IP of the system where the ICAP DLP is deployed.
ICAP Port	Leave the default value of 1344 or use 11344 for secure ICAP. In rare cases, this might need to be changed to whatever port the ICAP DLP server is listening on.
Secure ICAP	Enable if the ICAP server is running with SSL or TLS protocols.
File Size Limit	To exclude very large files from scanning, specify the file size limit in bytes. Default value is 25MB.
ICAP Service Name	Consult the ICAP DLP server product documentation for this value. It must be set correctly; otherwise, integration won't work.

3. Click **Save**.

After you have configured its settings in FileCloud, you can use ICAP DLP with FileCloud Smart Classification to set metadata values.

Microsoft Teams

FileCloud can be configured to function within MS Teams so users can share content in Team's chats and channels.

To set up integration:

1. [The Teams administrator must create a FileCloud app.](#)
2. [The FileCloud administrator must enable Teams integration in FileCloud.](#)
3. Then, FileCloud users can add the FileCloud app to their Teams installations in order to share FileCloud content in messages and view the FileCloud browser while working in Teams.

For MS Teams Admins: Configuring FileCloud in Teams

Before users can access FileCloud through MS Teams, the Teams administrator must perform the following configuration in Teams. After that, the FileCloud Admin must [Enable FileCloud/Teams integration](#) in the FileCloud Admin portal.

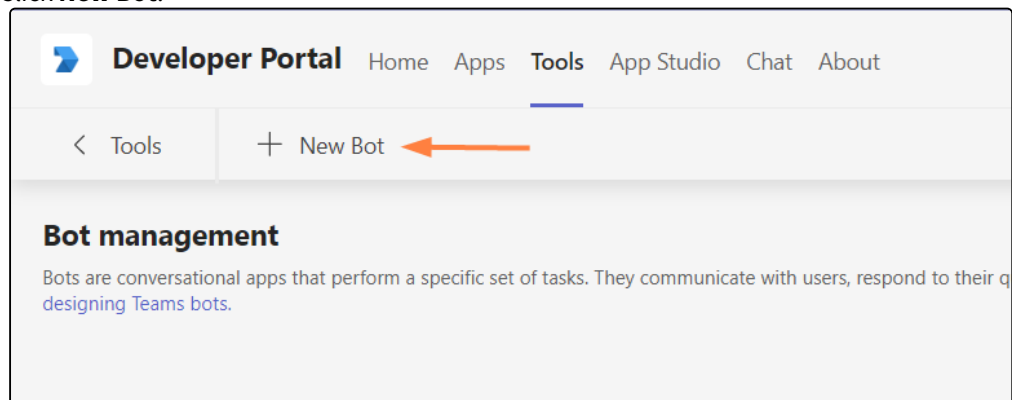

i FileCloud integration with MS Teams is available beginning in FileCloud Version 21.2

1. Confirm that you have FileCloud Version 21.2 or higher installed.
2. Create an MS Teams bot in the Teams' **Developer Portal**:
 - a. Open **MS Teams**.

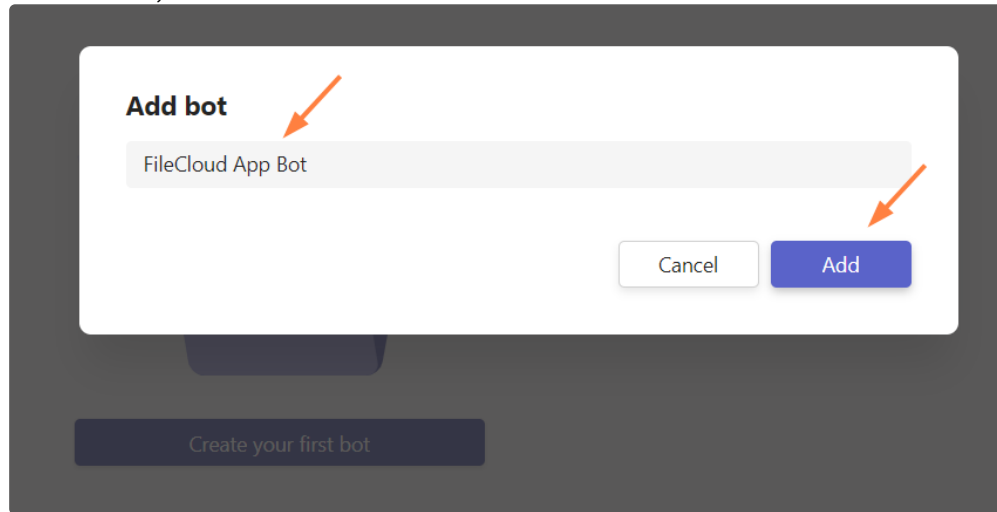

- b. If you do not have the **Developer Portal** app installed already, click the **More** icon in the navigation pane, search for **Developer Portal**, and add it.

- c. Click the **Developer Portal** icon in the navigation pane, and go to **Tools > Bot Management**.
d. Click **New Bot**.

e. Name the bot ,and click **Add**.

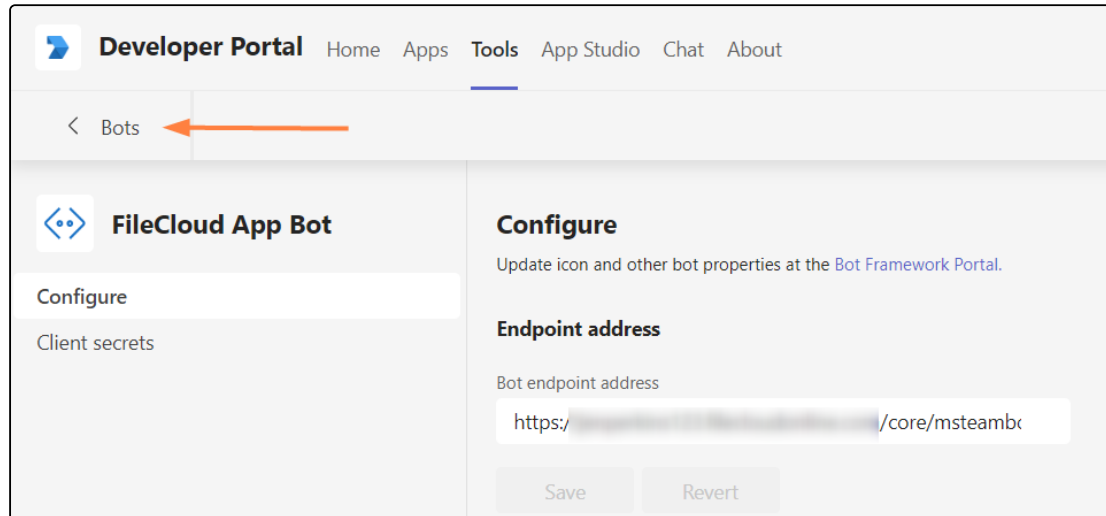

The bot appears opened on the **Tools** screen.

f. Change the **Endpoint address** to point to the bot in your FileCloud server, and click Save.
Use [https://\[your FileCloud server\]/core/msteamsbot](https://[your FileCloud server]/core/msteamsbot)

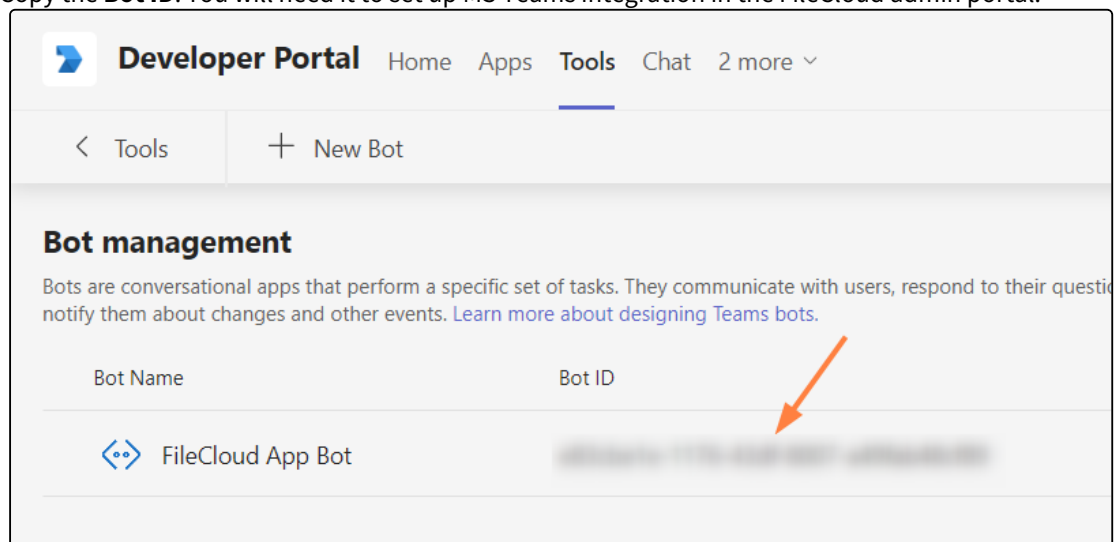

You are returned to the **Tools** screen.

g. Click **Bots**.

You go back to the **Bots Management** screen.

h. Copy the **Bot ID**. You will need it to set up MS Teams integration in the FileCloud admin portal.

3. Create the MS Teams application in Teams' **Developer Portal**.

- a. In the **Developer Portal**, click the **Apps** tab, and then click **New App**.

An **Add App** window opens.

- b. Enter a name for your FileCloud app and click **Add**.

The **Basic Information** screen for the app opens.

- c. Fill in the form, and click **Save**.

Depending on your MS Teams environment policies, you may not be required to enter a value for

Application (client) ID.

Branding

Apps require a color and outline icon in PNG format. To publish your app in the Teams store, these icons must meet specific size requirements.

Color icon

Displays in the store and in most scenarios. Icon must be 192x192 pixels total with a 96x96-pixel symbol in the center.

Outline icon

Displays primarily on the left side of Teams when your app is in use. Icon must be 32x32 pixels and either white or transparent.

Accent color

Displays for primary actions and other app UI components.

e. Download the following two images (right-click and choose **Save image as**).

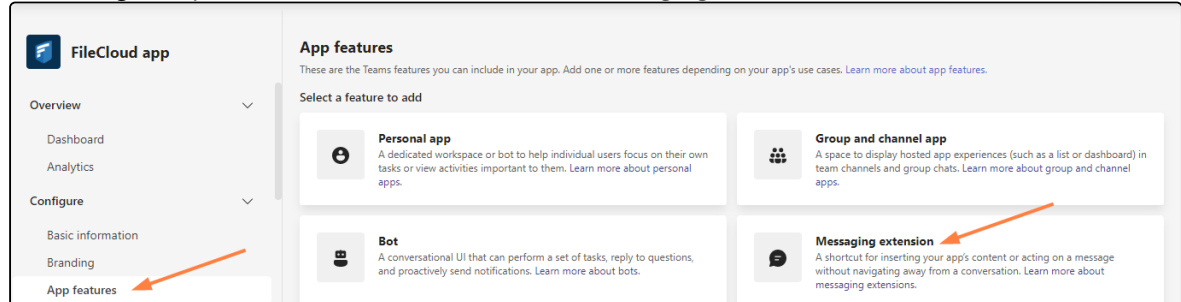

f. Upload the first image for **Color icon**, and the second image for **Outline icon**.

You may use custom images, but they must be 192px X 192px for the color image and 32px X 32px for the transparent outline.

4. Set up your MS Teams bot.

a. In the navigation pane, click **App Features**, and click **Messaging Extension**.

The **Messaging Extension** screen opens.

b. Choose **Select an existing bot**, and select the FileCloud bot that you just created, and click **Save**.

5. Add your domain to a global domains list.

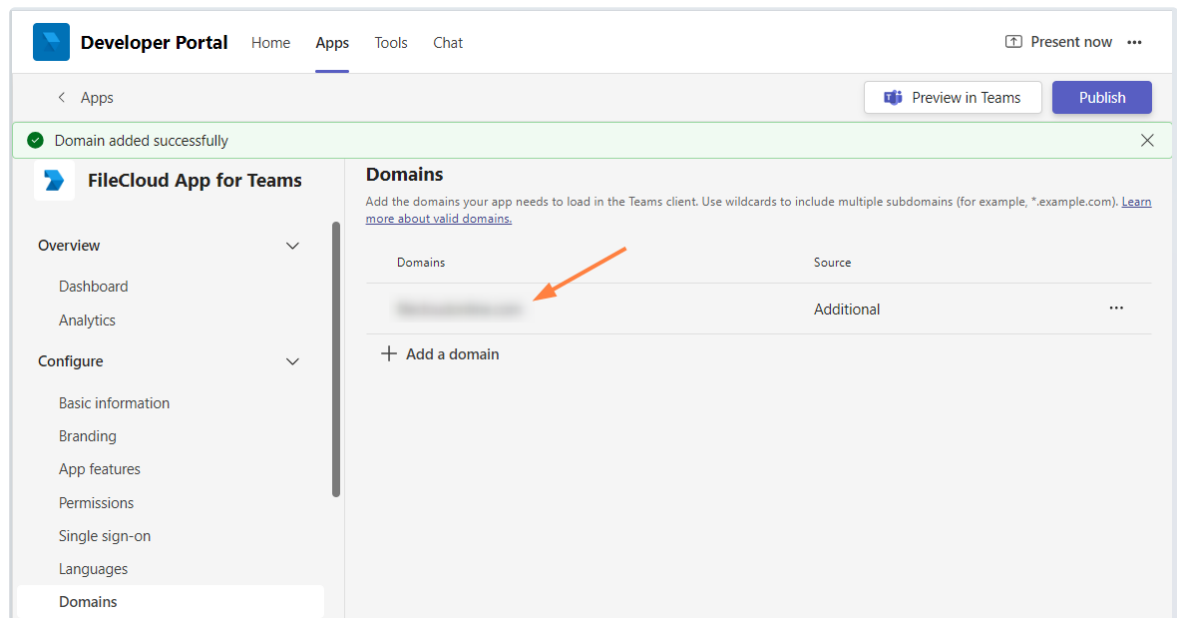

- a. In the navigation pane, click **Domains**, and then click **Create your first domain**.
(If you already have domains listed, click **Add a domain**.)

- b. In the **Add domain** dialog box, enter your domain (the same one you entered above, in step 4h).

- c. Click **Add**.
The domain is added to the list:

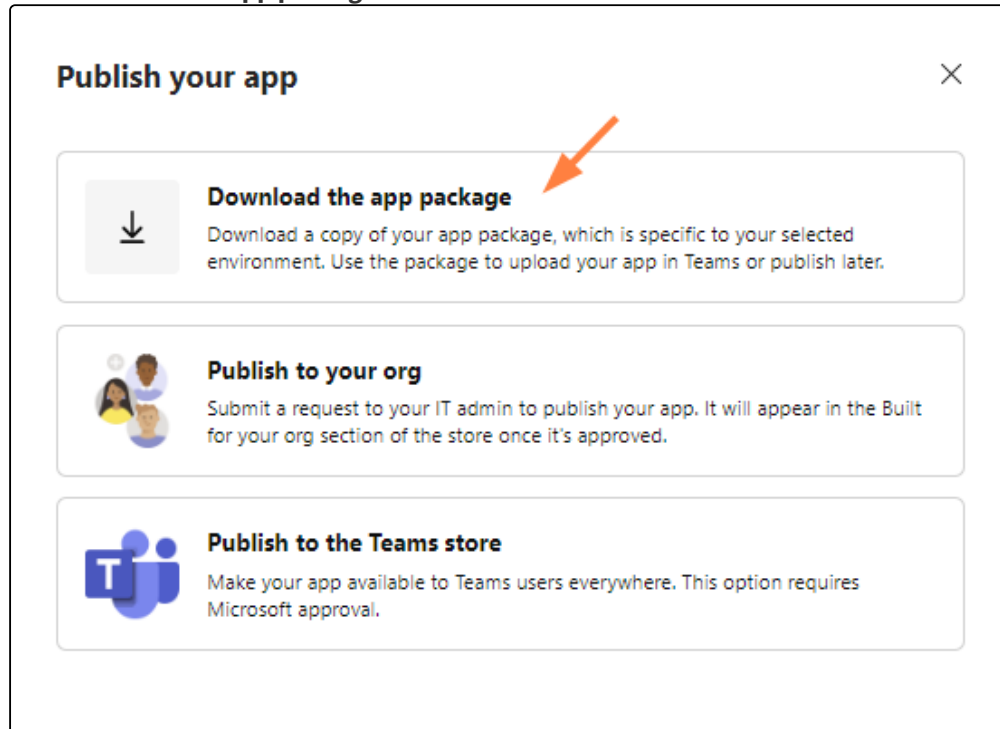

6. Export the application manifest zip file from Teams' **Developer Portal**.

a. Click **Publish**.

The **Publish your app** dialog box opens.

b. Click **Download the app package**.

c. Save the downloaded app package zip file.

7. Upload the application and submit it for approval in MS Teams.

a. In the MS Teams navigation pane, click **Apps**.

b. In the left panel click **Manage your apps**.

c. In the **Manage your apps** screen, click **Upload an app**.

The **Upload an app** dialog box opens.

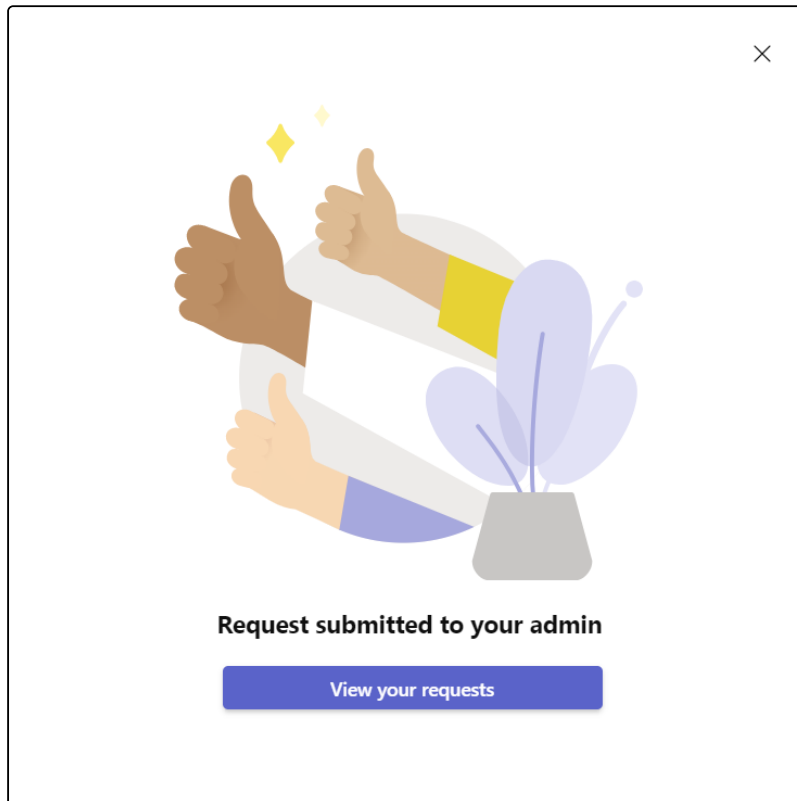

d. Click **Submit an app to your org**.

Your file explorer opens.

e. Select your app package zip file.

You should now see:

f. As the Teams administrator, approve and publish the app.

For more information, see <https://docs.microsoft.com/en-us/MicrosoftTeams/manage-apps#approve-a-custom-app>.

The app's **Status** changes to **Approved**, and the app becomes available in your company's app store.

8. Next [enable MS Teams integration in FileCloud](#)

For FileCloud Admins: Enabling Integration with MS Teams

After [FileCloud configuration in MS Teams](#) has been completed by a Teams administrator, a FileCloud administrator must enable FileCloud/MS Teams integration in the FileCloud Admin portal.

i If you update FileCloud from a version prior to 21.2, you must manually add some configurations to the .htaccess file so that login to FileCloud from MS Teams works correctly. See [For FileCloud Admins: Enabling Integration with MS Teams](#), below.

i FileCloud Server must be able to communicate with Microsoft Servers in order for this integration to work. Internet connectivity, or access to the URL <https://login.botframework.com/v1/.well-known/keys> is required, as well as 2-way communication with the domains [teams.microsoft.com](#), [*.teams.microsoft.com](#), and [*.skype.com](#).

Note regarding Chrome and Edge users

Users who access MS Teams through Chrome or MS Edge will not be able to log in to FileCloud from MS Teams' FileCloud tab unless the cookie **SameSite** value is set to **None**.

For instructions on setting the **SameSite** value, see Improving Cookie Security.

To enable FileCloud integration with MS Teams:

1. Open the MS Teams settings page.

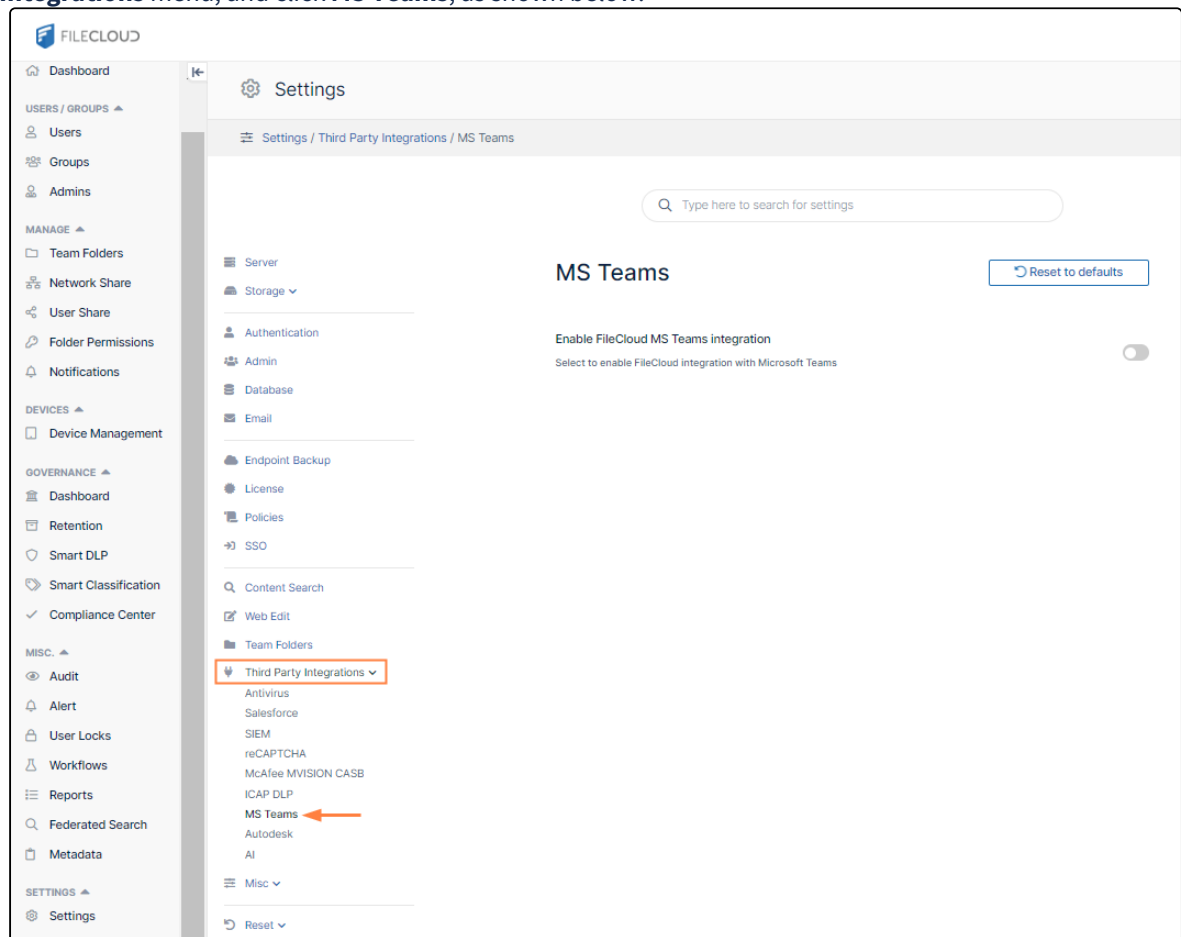

To go to the MS Teams settings page

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on the Settings

navigation page, click **Third Party Integrations**.

- b. In the inner navigation bar on the left of the Third Party Integrations page, expand the **Third Party Integrations** menu, and click **MS Teams**, as shown below.

The **reCAPTCHA** settings page opens.

Open the **reCAPTCHA** settings page.

2. Enable the field **Enable FileCloud MS Teams integration**.
3. Enter the MS Teams Bot Id into **FileCloud MS Teams bot ID**.
Get the MS Teams Bot Id from the Teams administrator or from Bot Management in MS Teams' App Studio app (see [For MS Teams Admins: Configuring FileCloud in Teams](#)).
4. Check **Use browser session expiry** to use the FileCloud session timeout setting (located in **Settings** on the **Server** tab).

MS Teams Reset to defaults

Enable FileCloud MS Teams integration Toggle On
Select to enable FileCloud integration with Microsoft Teams

FileCloud MS Teams bot ID Text Input Field
Set FileCloud MS Teams Bot Id

User browser session expiry Toggle On
Use FileCloud browser session timeout only

5. Click **Save**.

Configuration after FileCloud upgrade

If you upgrade FileCloud from a version prior to 21.2, edit your .htaccess file so that login to FileCloud from MS Teams works correctly:

1. Open the **.htaccess** file:
 - in Windows, C:\xampp\htdocs\.htaccess
 - in Linux, /var/www/.htaccess
2. Find the **Content-Security-Policy** header.
3. Add:

teams.microsoft.com *.teams.microsoft.com *.skype.com

 to each of the following three directives in the Content-Security-Policy:
 - **script-src**
 - **frame-src**
 - **frame-ancestors**

2. Make sure that each directive is followed by 'self' and ends with a semicolon.

Example configuration:

```
<IfModule mod_headers.c>
Header set X-Frame-Options "SAMEORIGIN"
Header set X-Content-Type-Options "nosniff"
Header set Strict-Transport-Security "max-age=31536000; includeSubDomains"
Header set X-XSS-Protection "1; mode=block"
Header set Content-Security-Policy: "default-src 'self' *.live.com *.amazonaws.com *.core.windows.net www.google.com
http://127.0.0.1:34320/v1/fileassociations; style-src 'unsafe-inline' 'self';script-src 'unsafe-inline' 'unsafe-eval'
'self' www.google.com www.gstatic.com docs.google.com teams.microsoft.com *.teams.microsoft.com *.skype.com;frame-src
'self' www.google.com *.live.com docs.google.com teams.microsoft.com *.teams.microsoft.com *.skype.com; font-src 'self'
data;img-src www.gstatic.com 'self' data: *.duosecurity.com *.live.com *.amazonaws.com *.core.windows.net *.office.net;
frame-ancestors 'self' teams.microsoft.com *.teams.microsoft.com *.skype.com;"
</IfModule>
```

Redirection to Login Screen

If you have integrated your system with MS Teams, and login frequently redirects users back to the login page:

1. Open cloudconfig.php:
Windows Location: XAMPP DIRECTORY/htdocs/config/cloudconfig.php
Linux Location: /var/www/config/cloudconfig.php
2. Add the following settings:

```
define("TONIDOCLOUD_COOKIE_SAME_SITE_TYPE", "None");
define("TONIDOCLOUD_SECURE_COOKIE", 1);
define("TONIDOCLOUD_HTTPONLY_COOKIE", 1);
```

Setting Up AutoCAD File Preview with Autodesk Viewer

⚠ Beginning with FileCloud 23.1, if a file has multiple 2D and 3D viewing options, the Autodesk viewer in FileCloud lets users display the different views.

i Integration with Autodesk Viewer is available in FileCloud Version 22.1 and higher. Each time an AutoCAD file is previewed, it is stored outside FileCloud on Autodesk's servers for 30 days. The first time an AutoCAD file is previewed from your site, Autodesk charges you in flex tokens (cloud credits). Subsequent times the (unmodified) file is previewed, by any user on the site, you are not charged. You are charged again the initial time a file is previewed after being modified. For information about purchasing flex tokens, see <https://forge.autodesk.com/pricing>

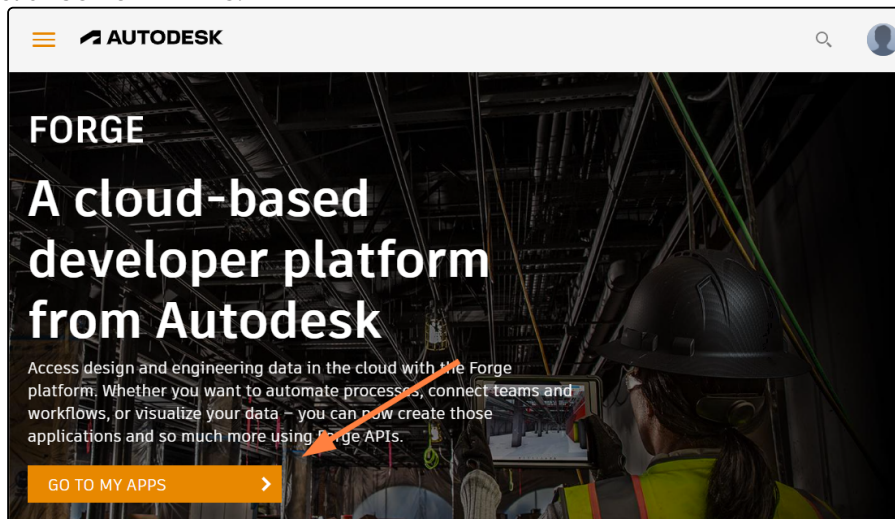

After you configure FileCloud integration with Autodesk Viewer, when users preview 3D and 2D model data file types, they are shown in Autodesk Viewer.

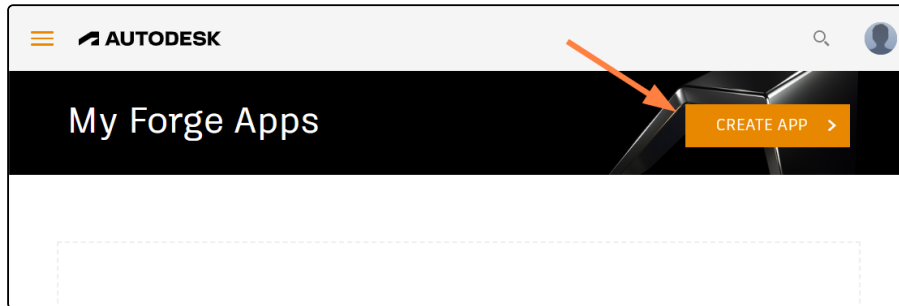

Setting up integration of FileCloud and Autodesk Viewer

Note: If your firewall blocks URLs that do not appear in an allowed list, make sure you add the Autodesk URL to the allowed list.

To integrate FileCloud with Autodesk Viewer:

1. Go to <https://forge.autodesk.com/>.
2. Sign in to your Autodesk account, or create a new one.
3. Click **GO TO MY APPS**.

4. Click **CREATE APP**.

5. Fill in the fields.

- For Callback URL, enter your FileCloud url + **/core/cadviewer**, for example, <https://myfilecloudurl.com/core/cadviewer>.
- You may leave **Site URL** blank, but must fill all other fields.

App information

Provide basic information about your app.

12. Click **Save**.

13. Make the following change to the Apache SSL config file in the **<VirtualHost>** definition:

- a. Open httpd-ssl.conf:

Windows Location: **XAMPP DIRECTORY\apache\conf\extra\httpd-ssl.conf**

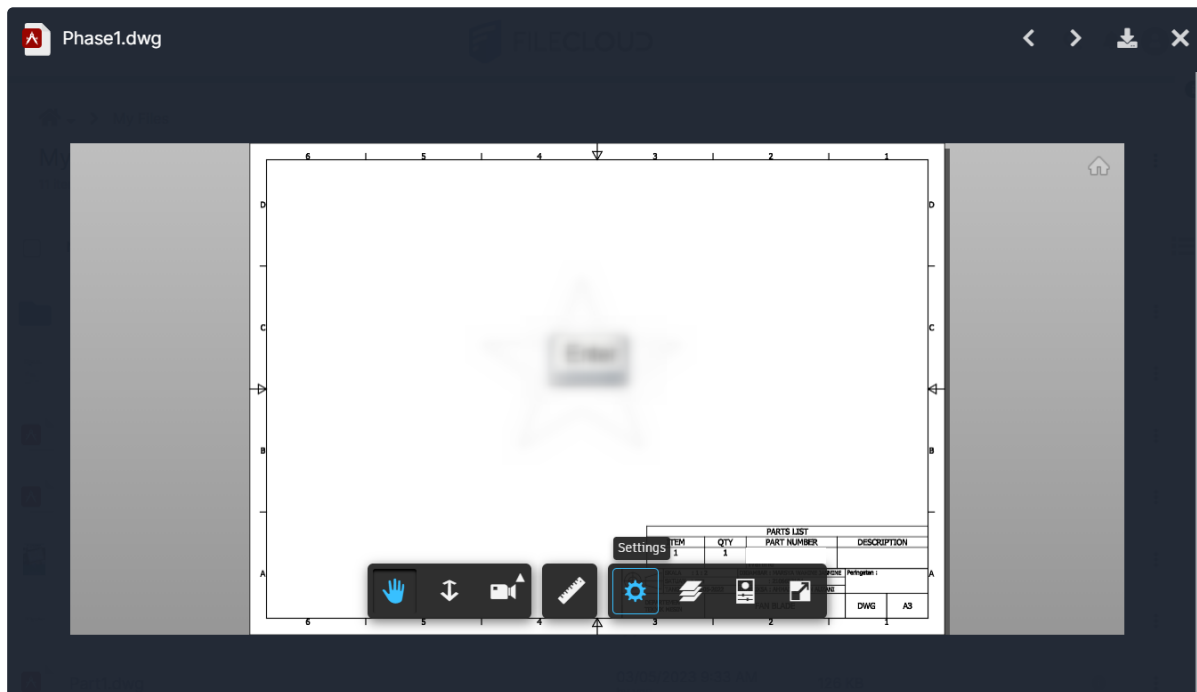

Linux Location: **/etc/apache2/sites-enabled/000-default.conf**

- b. Near the end of the file, but before **</VirtualHost>** , add the following:

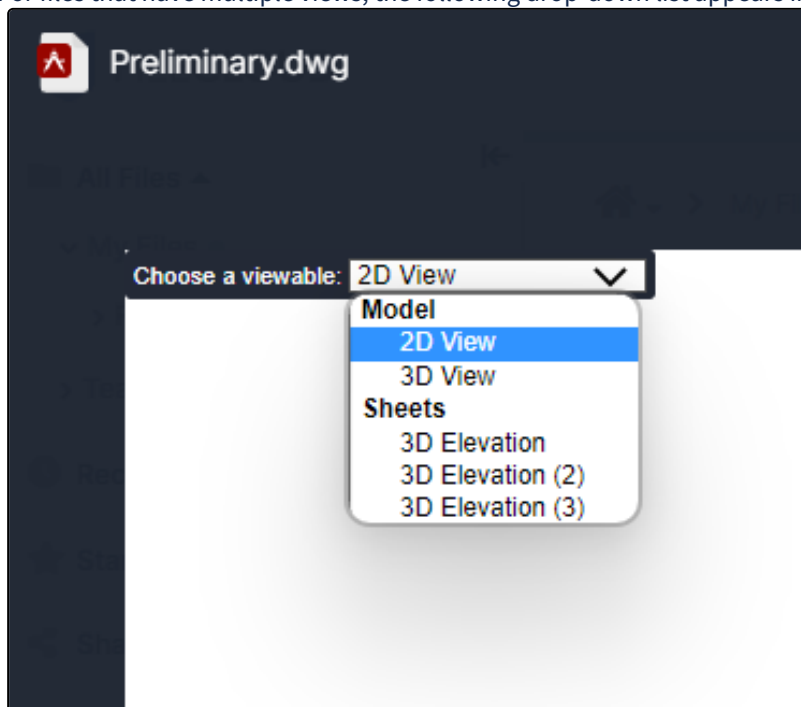

```
AllowEncodedSlashes NoDecode
```

Your integration of Autodesk Viewer and FileCloud is now complete.

When users preview a model data file in FileCloud, they see the image in a screen similar to:

For files that have multiple views, the following drop-down list appears in the upper-left corner:

Note: The drop-down list with multiple options for viewing only appears for files that have multiple views available.

AI Integration

i The ability to configure a Large Language Model for FileCloud Smart Classification is available in versions 23.232 and higher.

FileCloud's Smart Classification includes an AI classifier which requires integration with a Large Language Model (LLM) to function. A Large Language Model, which is trained on very large amounts of data, is a type of algorithm used in AI.

Currently, OpenAI is the only provider available for integrating FileCloud with a LLM.

To integrate FileCloud with OpenAI:

1. Open the AI settings page.

To go to the AI settings page

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on the **Settings** navigation page, click **Third Party Integrations** .
- b. In the inner navigation bar on the left of the **Third Party Integrations** page, expand the **Third Party Integrations** menu, and click **AI**, as shown below.

The screenshot shows the FileCloud Server Settings interface. On the left is a sidebar with a navigation menu. The main content area is titled 'Settings' and 'Third Party Integrations / AI'. A search bar is at the top right of the main area. Below the search bar, there's a 'Reset to defaults' button. The main content area is titled 'AI' and contains a toggle switch for 'Enable LLM features'. Below the toggle, there's a description: 'Select to enable FileCloud integration with LLM (Large Language Model)'. In the sidebar, the 'Third Party Integrations' menu item is highlighted with a red box, and the 'AI' sub-item is pointed to by a red arrow.

3. Check **Enable LLM Features**.

4. In **Provider**, choose **OpenAI**.

5. Enter the values for **LLM provider API Key** and **Organization ID**.

To get these values, log in to the OpenAI platform at <https://platform.openai.com/login> (you must have a valid OpenAI subscription) and click **API keys** in the left navigation panel.

The **API keys** page opens:

API keys

Your secret API keys are listed below. Please note that we do not display your secret API keys again after you generate them.

Do not share your API key with others, or expose it in the browser or other client-side code. In order to protect the security of your account, OpenAI may also automatically disable any API key that we've found has leaked publicly.

NAME	KEY	CREATED	LAST USED ⓘ	
filecloud_test_key	[REDACTED]	Jun 14, 2023	Jul 20, 2023	
postman test key	[REDACTED]	Nov 13, 2023	Never	

[+ Create new secret key](#)

Default organization

If you belong to multiple organizations, this setting controls which organization is used by default when making requests with the API keys above.

FileCloud R&D

Note: You can also specify which organization to use for each API request. See [Authentication](#) to learn more.

On the **API keys** page:

- Click **Create new secret key** and create a new key. Copy and save it (you cannot access it again through your AI account), and then enter it into **API key** on the FileCloud **AI Integration Settings** page.

Create new secret key

Please save this secret key somewhere safe and accessible. For security reasons, **you won't be able to view it again** through your OpenAI account. If you lose this secret key, you'll need to generate a new one.

[REDACTED]

Done

- Under **Default organization**, view your organizations, and optionally, enter one into **Organization** on the FileCloud **AI Integration Settings** page to have it used with each API request.

6. In **Model**, enter the value for your model. For help determining your model, see <https://platform.openai.com/docs/models>.

7. In most cases you are not required to enter a **Custom URL**. It is only necessary if you use a custom OpenAI instance.
8. Click **Test Credentials** to confirm that **FileCloud** and **AI** are properly integrated.

✖ To ensure optimal functionality and avoid disruptions, confirm that the LLM you select is currently supported by OpenAI. View the list of supported models and their deprecation timelines on [OpenAI's model deprecation page](#).

CDR Integration

i FileCloud integration with Forcepoint CDR is available in version 23.241.4 and higher. Forcepoint CDR is only available for customers with Advanced licenses; if you are upgrading FileCloud and intend to use Forcepoint CDR, please also upgrade your license.

When Forcepoint CDR (Content Disarm and Reconstruction) is integrated with FileCloud, each file (of a supported type) uploaded into FileCloud is put into a non-editable quarantine state and sent to Forcepoint CDR. Forcepoint CDR rebuilds the file, omitting any potentially malicious code, and returns the sanitized file to FileCloud.

Limitations:

- Forcepoint CDR does not send a notification to the user's FileCloud account if a threat is found; it simply returns the file to FileCloud with the threat removed.
- Only files in Network Folders that are changed within FileCloud are scanned and sanitized; files in Network Folders that are changed outside FileCloud are not.
- File changes made to a file in a WOPI Web edit co-editing session are not sent to Forcepoint for sanitization until all users in the session have closed the file for edit.
- While a file is in quarantine, FileCloud rejects new uploads of the file.

Integrating Forcepoint CDR with FileCloud

Required settings:

- Forcepoint CDR integration works only if locking is enabled (the default setting). For help enabling locking, see Misc Settings.
- We recommend setting **Number of old versions to keep for each file** to **1** or higher (default is **3**) before using Forcepoint CDR integration to avoid losing data. Without this setting, loss of original versions of files will occur if Forcepoint CDR returns an unsupported file and **Delete extensions that Forcepoint CDR does not support** is enabled. For help setting this value, see Setting up Managed Storage.

To set up integration Forcepoint CDR with FileCloud:

1. Open the **Forcepoint CDR** page.

To go to the Forcepoint CDR page

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on

the **Settings** navigation page, click **Third Party Integrations** .

- b. In the inner navigation bar on the left of the **Third Party Integrations** page, expand the **Third Party Integrations** menu, and click **Forcepoint CDR**, as shown below.

The screenshot shows the 'Settings' page in FileCloud Server. The breadcrumb trail is 'Settings / Third Party Integrations / Forcepoint CDR'. A search bar is present with the placeholder text 'Type here to search for settings'. On the left sidebar, the 'Third Party Integrations' menu item is highlighted with a red box. Below it, a list of integrations is shown, with 'Forcepoint CDR' selected and indicated by an orange arrow. The main content area is titled 'Forcepoint CDR' and features a toggle switch for 'Enable FileCloud FORCEPOINT integration', which is currently turned off. A 'Reset to defaults' button is located in the top right corner of the main content area.

File Size Limit

Do not upload files greater than this size to Forcepoint CDR.

Units ▾

25

MB

Disallowed File Extensions

Do not upload these extensions to Forcepoint CDR. Use | as the delimiter.

Delete extensions that Forcepoint CDR does not support

When Forcepoint CDR returns files with unsupported extensions to FileCloud, delete them.

3. Fill in the fields as indicated in the following table.

Field	Description	Default value	Notes
Enable FileCloud FORCEPOINT Integration	Turn integration with Forcepoint CDR on and off.	disabled	
Check CDR	Click to confirm that your CDR URL is valid.	N/A	
CDR URL	The URL of your company's Forcepoint CDR server	blank	

Field	Description	Default value	Notes
File Size Limit	The largest size of a file that FileCloud can send to Forcepoint CDR.	25	The maximum size we have tested that was processed successfully in Forcepoint was 100 MB. However, the maximum size any Forcepoint server can process depends on the hardware configuration of the Forcepoint server.
Disallowed File Extensions	File extensions that you want to prevent from being uploaded to Forcepoint CDR. These files remain in FileCloud but are not sanitized. (There are also file types that Forcepoint CDR cannot process. These files are treated differently; they are uploaded to Forcepoint and returned as unsupported).	blank	
Delete extensions that Forcepoint CDR does not support	Deletes files that are returned because they have extensions that Forcepoint CDR does not support. File types that are not supported for sanitization include file types that Forcepoint does not support in general, such as PSD and MP4, and file types blocked by your Forcepoint CDR configuration. For more information see Forcepoint's online CDR help .	disabled	

4. To ensure that integration with Forcepoint CDR runs efficiently, add the following configuration in the message queue config file:

a. Open the message queue config file:

Windows location: **C:\xampp\htdocs\src\Scripts\config\default.json**

Linux location: **/var/www/html/src/Scripts/config/default.json**

b. Set the field **parallel_high_priority_workers_count** to a value of **1** or higher.

We recommend initially setting the value to around 20% of the value in **parallel_workers_count**, and modifying it as necessary for your environment.

If Forcepoint CDR cannot sanitize a file due to an error a notification is sent to the user and both a notification and an email are sent to the admin.

- Files that cannot be sanitized due to an error are repeatedly resent for sanitization until it is successful or the admin goes to the **Quarantined Files** page and either deletes the non-sanitized file version or removes it from quarantine.

- If **Delete extensions that Forcepoint CDR does not support** is enabled, files with extensions that are not supported by Forcepoint CDR are deleted from FileCloud. If there is a prior version of the file in FileCloud (if it was an update to a file) the original version is not deleted.
- To customize the email sent to the user, go to Customization > Email Templates and edit the template **Errors During Sanitization On Forcepoint CDR Email Template**.

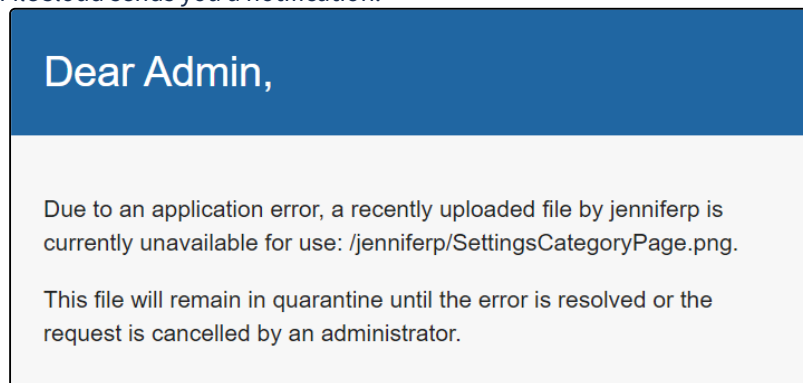

While a file is being sanitized, the file and its parent folders are locked for editing and other changes. The screen does not reflect that the file has been returned from Forcepoint CDR and is now unlocked until the user refreshes the screen, as in the following video.

Notice that the size of the file in the video is reduced after processing. This may happen when the file is recreated in Forcepoint CDR, making it slightly smaller or larger. If it takes longer than a minute to process the uploaded/modified file in Forcepoint CDR, the file's modified date will reflect the time change.

Deleting file versions in quarantine

If a file cannot be sanitized due to an error, it is repeatedly resent for sanitization until it is successful or an admin either deletes the non-sanitized file version or removes it from quarantine. Each time it is sent for sanitization and fails FileCloud sends you a notification:

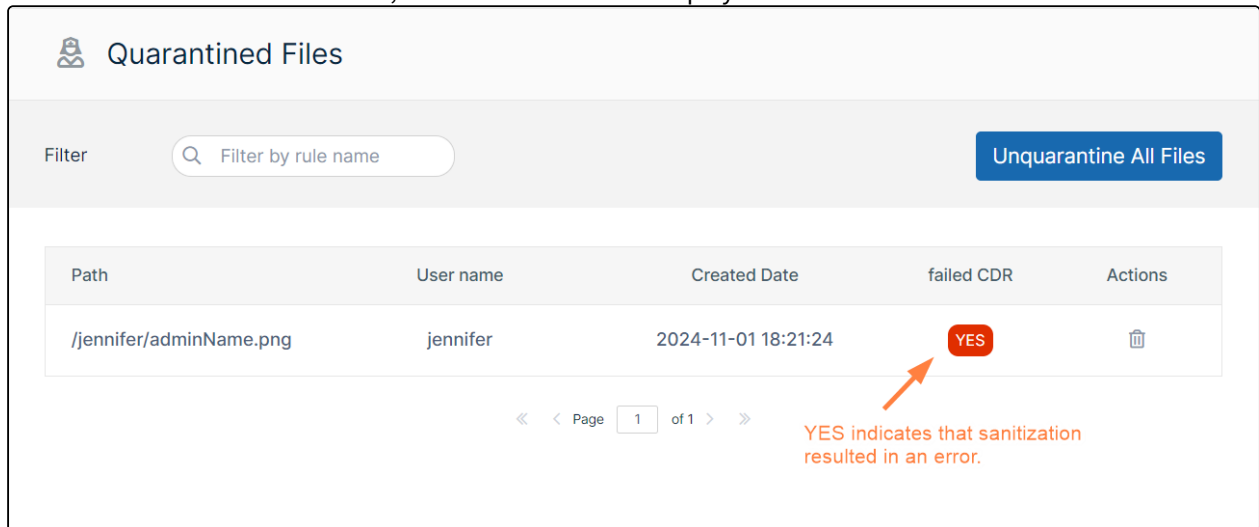

The file listed in the **Quarantined Files** screen is the version of the file that has been quarantined and sent for sanitization, which is the latest version of the file. Earlier versions of the file may exist in FileCloud and will remain in FileCloud even if you delete the versions in quarantine.

To delete a file that is repeatedly being sent for sanitization:

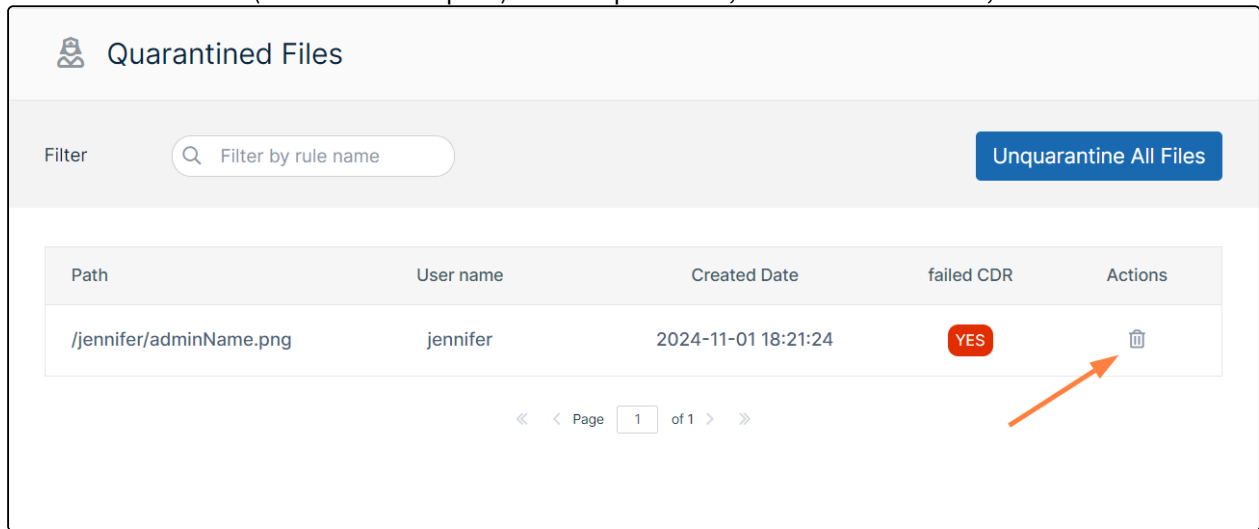

1. In the admin portal navigation panel, click **Quarantined Files**.
All quarantined files are listed, including those that haven't finished the initial sanitization process as well as those that are being repeatedly sent for sanitization due to an error.

Files listed because they have not finished the initial sanitization process do not have the **Delete** option. If files are listed because of an error, the failed CDR column displays **YES**.

The screenshot shows the 'Quarantined Files' interface. At the top, there is a filter section with a search bar labeled 'Filter by rule name' and a button 'Unquarantine All Files'. Below this is a table with the following columns: Path, User name, Created Date, failed CDR, and Actions. A single row is displayed with the following data: Path: /jennifer/adminName.png, User name: jennifer, Created Date: 2024-11-01 18:21:24, failed CDR: YES, and Actions: a trash can icon. An orange arrow points from the text 'YES indicates that sanitization resulted in an error.' to the 'YES' value in the 'failed CDR' column. At the bottom of the table, there is a pagination bar showing 'Page 1 of 1'.

2. To delete a file version (a sanitization request) stuck in quarantine, in the **Actions** column, click the Delete icon.

This screenshot is identical to the previous one, showing the 'Quarantined Files' page with the same table and data. However, an orange arrow now points from the text 'The file no longer appears in the Quarantined Files page.' to the trash can icon in the 'Actions' column of the table row.

The file no longer appears in the **Quarantined Files** page.

The deleted version of the file is removed from FileCloud, and is no longer sent for sanitization.

Note: If this is the only version of the file in FileCloud, the file is deleted permanently from FileCloud and is not sent to the recycle bin.

Removing all files from quarantine

The **Quarantined Files** page includes a button for removing all files from quarantine. If you click this button, all file versions in quarantine, including those that have not yet completed the sanitization process and those that are stuck in the sanitization process due to an error, are removed from quarantine but not deleted from FileCloud. All of these versions of files become available for use in FileCloud in their non-sanitized state.

To remove all files from quarantine:

1. In the admin portal navigation panel, click **Quarantined files**.
All quarantined files are listed.

Quarantined Files

eSignature Integration

i Integration of FileCloud with Signority's eSignature platform is available in FileCloud versions 23.241.4 and higher.
Some user's plans may not include the digital signature option discussed here.

x To ensure that your connection to Signority works properly, if you are using a firewall or blocking public connections, please allow requests from 52.60.130.76, Signority's IP address.

FileCloud can be configured to integrate with Signority's eSignature platform to enable your users to submit files for eSignatures.

How the eSignature process works

In FileCloud, the user selects one or more files to be signed. FileCloud creates a new PDF containing the file or files and prompts the user to specify a name for the PDF, a location for the signed document in FileCloud, and recipients who will be sent the document for signing. (The original files remain as they are, and can be used to create other signature documents.)

After the eSignature document is created, the user sends it from FileCloud to Signority and is prompted to add signature fields to the document for each recipient. The user then directs Signority to send signing requests to each recipient.

Users have the option of sending a document for eSignature or digital signature. To understand the difference between eSignatures and digital signatures, see [signority-esignature-vs-digital-signature-infographic.pdf](#)

The user can now follow the signature document's status in FileCloud when the recipients sign it, and it moves from **In Progress** to **Completed**. The user also receives emails when each recipient finishes signing the document and when all recipients have finished signing.

Now, the user can access the signed PDF in the FileCloud location specified for storing the signed document.

i eSignature documents for signing requests that are in draft or in progress are stored in Signority as well as FileCloud. When a signing request is completed, deleted, or expired, the eSignature document is removed from Signority.

The signer's experience

Reviewing and signing the document

The signer receives an email alerting them that a document is waiting for them to sign it. The signer clicks a link in the email to access the document in Signority. Once the user has reviewed the document in Signority they can sign it, and their task is complete. Signority automatically sends the signed document back to FileCloud.

Prerequisites for FileCloud/Signority integration

- You must have a trial or paid Signority account, obtained either prior to setting up integration or obtained through FileCloud's admin portal **eSignature** screen.

- eSignature must be enabled in a user's policy for the user to be able to use the eSignature feature. By default, the feature is enabled in all policies.
- Document Converter must be installed and running in FileCloud.

File types supported for eSignature

The file types currently supported in FileCloud for eSignature are:

- PDF
- DOCX
- PPTX
- PNG
- JPG/JPEG

File types that are not supported for eSignature do not show the **eSignature** option in the More [...] drop-down list.

Limitations

- The combined size of all files in a single signing request may not exceed 50 MB.
- Translations of the user interface are available in Arabic, French, Portuguese, and Spanish.
However:
 - Messages from the server, which appear when users view a request in the eSignature screen, are not translated.
 - The admin portal does not support these translations.
- Audit details are omitted by default, but can be returned combined with an eSignature document or as a separate file. See [To return audit details](#), below, for information on returning audit details.
- DLP rules that block files from being shared do not block them from being sent for eSignatures.

Integrate FileCloud with Signority

The first time you access the eSignature screen you are required to either obtain a trial Signority account through FileCloud or enter the credentials for your existing Signority account

To enable eSignature:

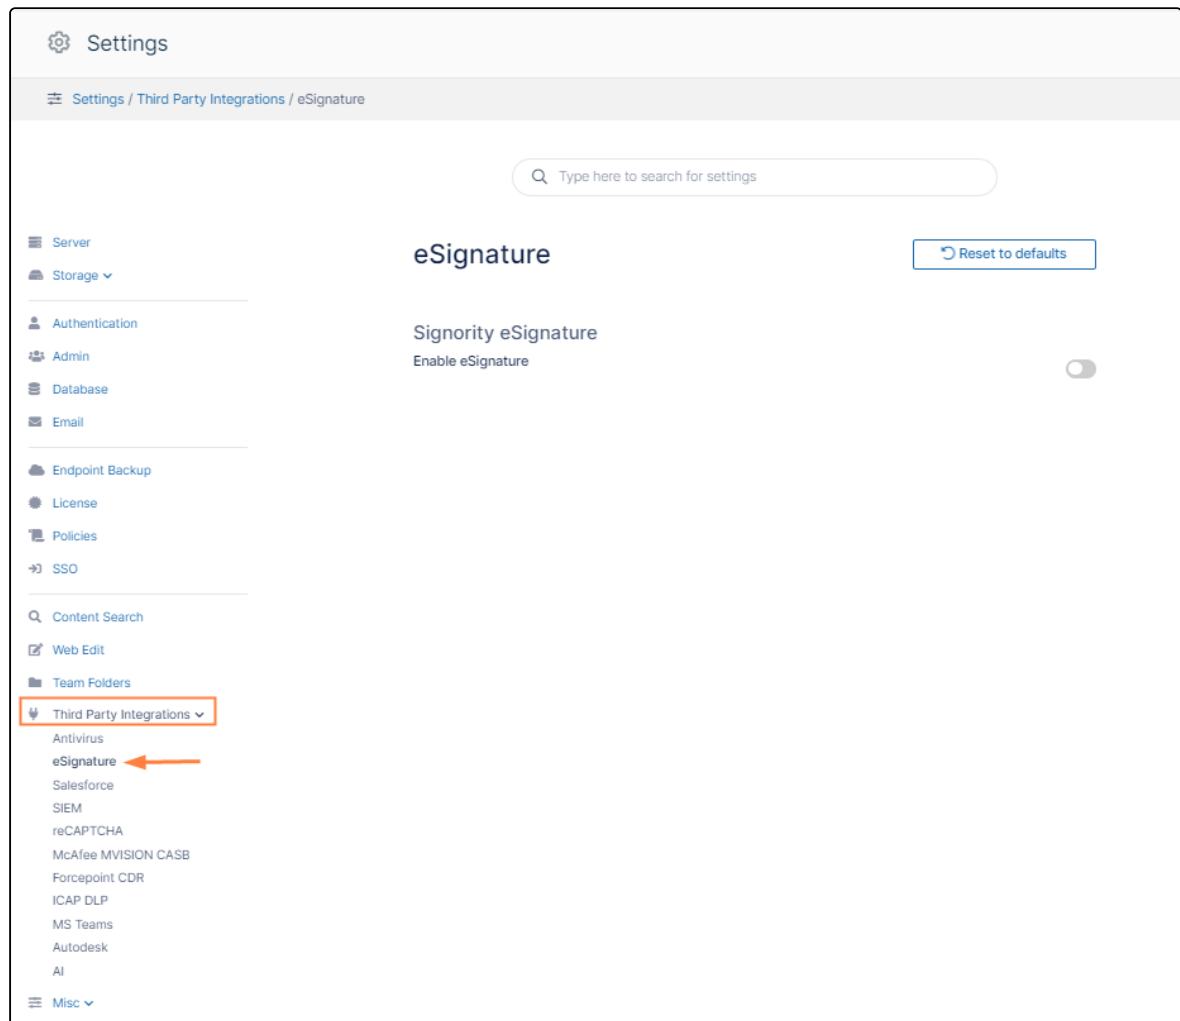

1. Install and run FileCloud Document Converter if it is not running already. For help, see FileCloud Document Converter.
2. Go to the **eSignature** page.

To go to the eSignature page

- a. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on

the **Settings** navigation page, click **Third Party Integrations** .

- b. In the inner navigation bar on the left of the **Third Party Integrations** page, expand the **Third Party Integrations** menu, and click **eSignature**, as shown below.

The eSignature settings page opens.

3. Enable the **Enable eSignature** setting.

Fields for creating a trial Signority Account appear along with the link **Connect your account** for users who

already have accounts.

- [Signority Knowledge Base](#)
- [Quick Start Guide](#)
- [Go to Signority Dashboard](#)

Learn more

To create a trial Signority account:

1. Enter the information requested, and click **Create Signority Account**.

The screenshot shows the 'eSignature' section of the FileCloud settings. Under 'Signority eSignature', the 'Enable eSignature' checkbox is checked. Below this, there is a section titled 'Create a Signority account' with a link 'Already have an account? [Connect your account](#)'. The form contains four input fields: 'First name*' (Olivia), 'Last name*' (Graham), 'Email address*' (Olivia@example.com), and 'Password*'. The 'Confirm password*' field is highlighted with a blue border and an orange arrow pointing to it. A 'Create Signority account' button is located at the bottom right of the form.

Your Signority account is created. The screen now appears as follows, with **Enable eSignature** checked and your **API Key** automatically filled in.

2. Click **Test** to make sure integration with Signority works correctly.

The screenshot shows the 'eSignature' section after the account has been created. The 'Signority eSignature' section is visible, with 'Enable eSignature' checked. Below this, there is a 'Test API key' section with a text input field containing a masked API key (represented by dots) and a 'Test' button.

If the test returns a success message, FileCloud integration with Signority is complete, and your users are now

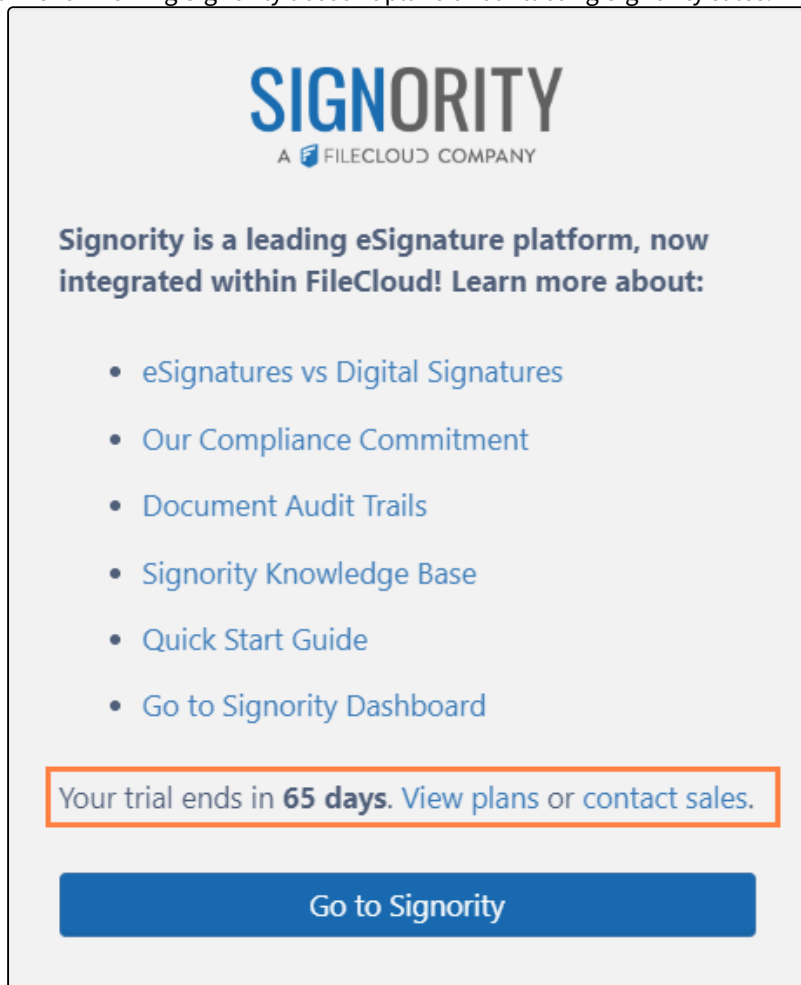

able to obtain eSignatures on files.

The trial account lasts for 90 days. You are sent notifications prior to expiration reminding you that before the trial expires, you must purchase a paid account to maintain eSignature capability.

If you haven't purchased a paid account by the time your trial account expires, any documents already sent for eSignature can still be signed and processed; however, no new documents can be sent for eSignatures.

To convert a Signority account from trial to paid

The eSignature screen includes Signority box that keeps count of the days remaining in your trial account and gives you links for viewing Signority account plans or contacting Signority sales:

A screenshot of a Signority trial expiration notification box. At the top is the Signority logo, which includes the word "SIGNORITY" in large blue letters and "A FILECLOUD COMPANY" in smaller text below it. Below the logo, the text reads "Signority is a leading eSignature platform, now integrated within FileCloud! Learn more about:". Underneath this is a bulleted list of links: "eSignatures vs Digital Signatures", "Our Compliance Commitment", "Document Audit Trails", "Signority Knowledge Base", "Quick Start Guide", and "Go to Signority Dashboard". Below the list, a message states "Your trial ends in 65 days. View plans or contact sales.", where "65 days" is in bold and "View plans or contact sales." is a link. At the bottom of the box is a blue button with the text "Go to Signority".

SIGNORITY
A FILECLOUD COMPANY

Signority is a leading eSignature platform, now integrated within FileCloud! Learn more about:

- [eSignatures vs Digital Signatures](#)
- [Our Compliance Commitment](#)
- [Document Audit Trails](#)
- [Signority Knowledge Base](#)
- [Quick Start Guide](#)
- [Go to Signority Dashboard](#)

Your trial ends in **65 days**. [View plans or contact sales.](#)

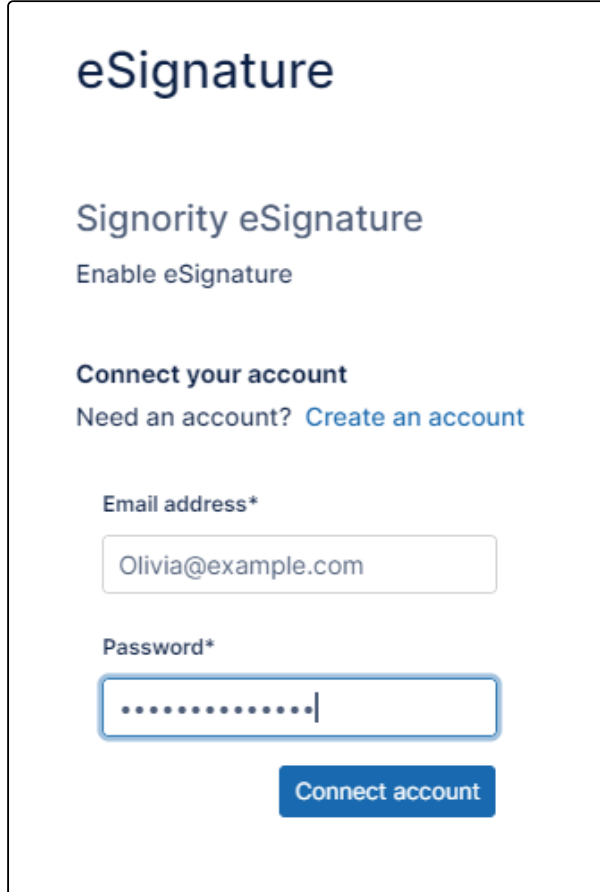

[Go to Signority](#)

Click **contact sales** to proceed with your Signority license purchase.

If you already have a Signority account:

- a. Click **Connect your account**.

- b. Enter your email address and password into the corresponding fields, and click **Connect Account**.

The screenshot shows a web interface for eSignature integration. At the top, it says "eSignature" in a large blue font. Below that, "Signority eSignature" is written in a smaller blue font, followed by "Enable eSignature" in a smaller grey font. A section titled "Connect your account" in bold blue font contains a link "Need an account? Create an account" in blue. Below this are two input fields: "Email address*" with the value "Olivia@example.com" and "Password*" with masked characters. A blue "Connect account" button is at the bottom right.

The screen now appears as follows, with **Enable eSignature** checked and your **API Key** automatically filled in.

- c. Click **Test** to make sure integration with Signority works correctly.

The screenshot shows the same web interface as before, but with the "Enable eSignature" checkbox checked. Below the "Signority eSignature" section, there is a "Test API key" label and a text input field containing masked characters. A blue "Test" button is located to the right of the input field.

If the test returns a success message, FileCloud integration with Signority is complete, and your users are now able to obtain eSignatures on files.

To enable/disable eSignatures for certain users:

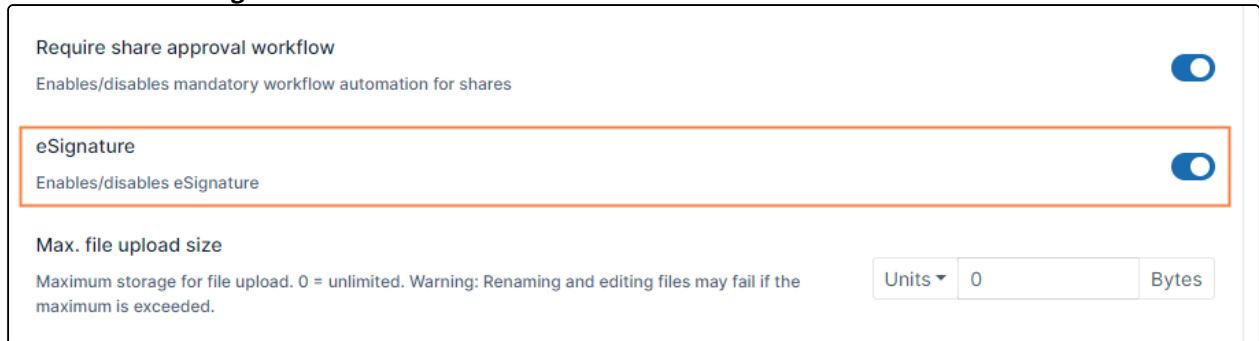

By default, the eSignature feature is enabled in users' policies.

1. In the FileCloud admin portal's left navigation bar, scroll down and click **Settings**. Then, on the **Settings**

navigation page, click **Policies**  .

The **Policies** page opens.

2. Edit the users' policy.
3. Click the **User Policy** tab.
Scroll down until you see the **eSignature** field.
4. Enable or disable **eSignature**.

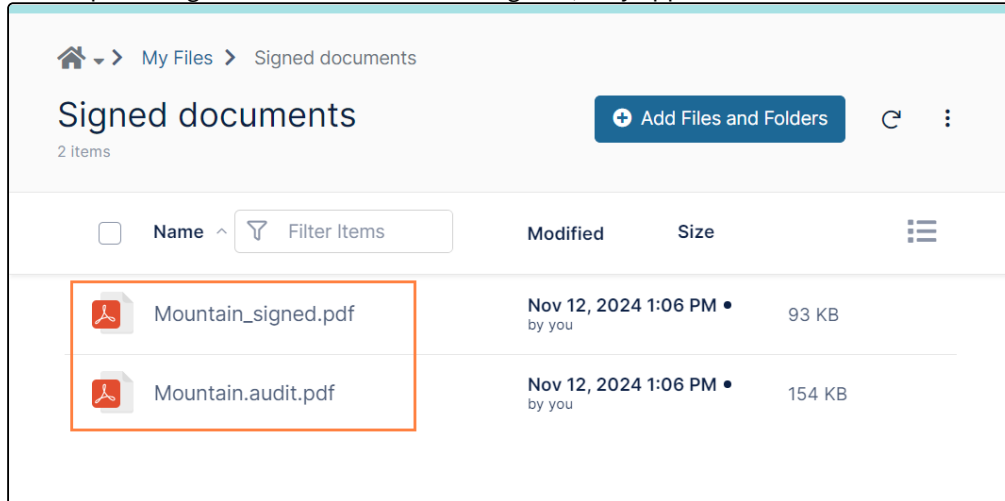

The screenshot shows the 'Policies' page in the FileCloud admin portal. It features three main sections: 'Require share approval workflow' (with a toggle switch), 'eSignature' (with a toggle switch and an orange border), and 'Max. file upload size' (with a text input field and a units dropdown). The 'eSignature' section is highlighted with an orange border, and its toggle switch is turned on. Below the 'eSignature' section, there is a note about the maximum storage for file upload.

For information about the eSignature process for users, see eSignature Requests.

To return audit details**When the files are accessed in FileCloud:**

By default, when the eSignature document is returned to the destination path specified by the user or the Completed panel in the eSignature page in FileCloud, the document is returned without audit details. However, you may configure the process to either return a separate audit file or audit details attached to the eSignature document in the destination folder,

When separate signed and audit files are configured, they appear in the destination folder as:

When audit details are attached to the eSignature document, the audit information follows the signature file in the eSignature pdf:

The options for receiving audit details are the following:

Setting code	Description
100	No audit details (default)
101	A separate audit file is sent to the destination with the eSignature document.
102	eSignature: Audit details are attached to the eSignature document. Digital signature: A separate audit file is sent to the destination with the eSignature document.

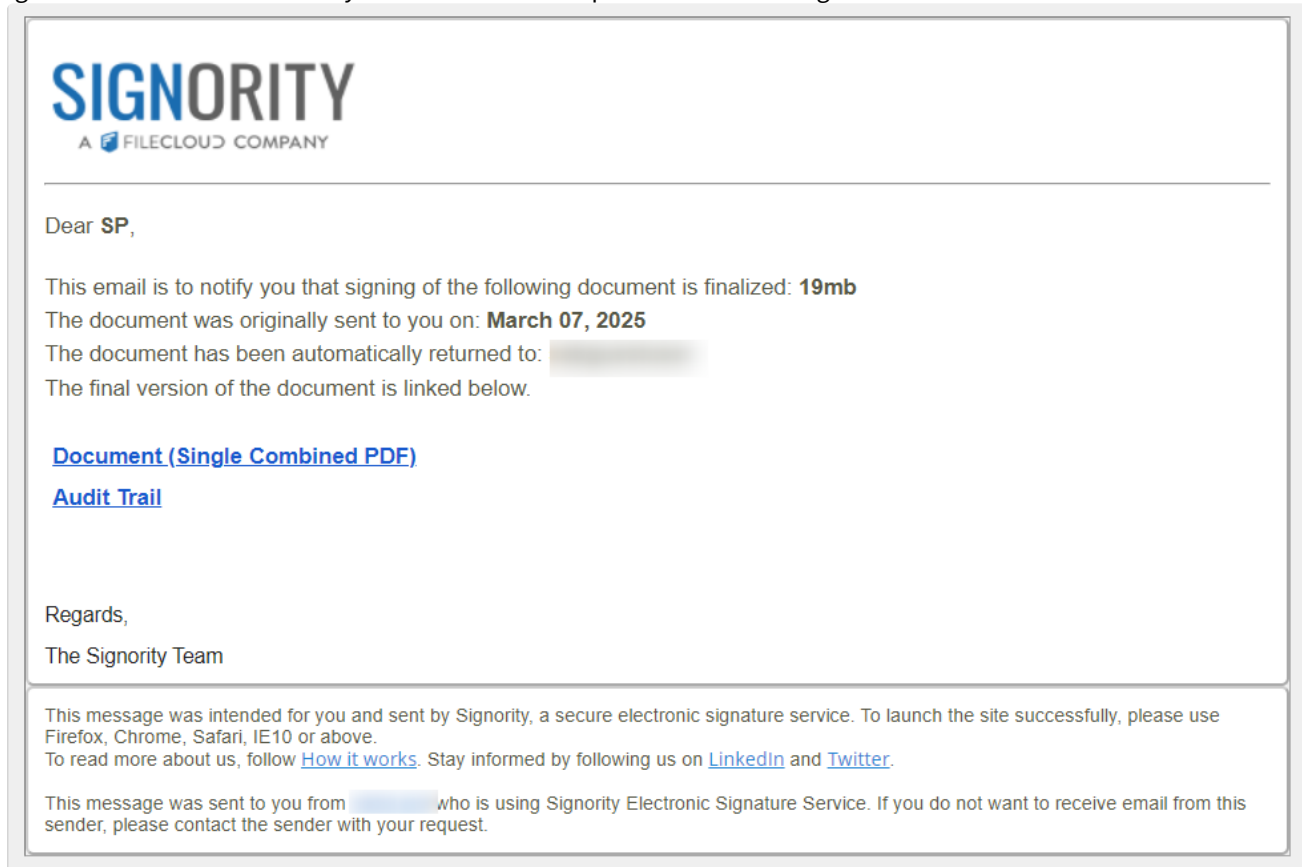

To change the audit details setting:

1. Open the cloudconfig.php file
Windows Location: XAMPP DIRECTORY/htdocs/config/cloudconfig.php
Linux Location: /var/www/html/config/cloudconfig.php
2. Add the following line, setting the value according to the codes specified above.

```
define('TONIDOCLOUD_ESIGNATURE_DEFAULT_AUDITTRAIL_SETTING', '101');
```

When the files are accessed from the Email notifying the requestor that the file has been signed:

By default, in the email notifying a signature requestor that an eSignature document has been signed, a link to the signed document is included. By default it includes separate links to the signed file and the audit details file.

However, since this email is sent from Signority, you can log in to Signority to configure whether or not the audit trail is sent as well as whether multiple signed documents are combined into a single PDF.

To specify what is included in the email notifying the requestor that the document has been signed:

1. Log in to Signority.
2. In the Signority navigation panel, click **Admin**, and then click **Settings > Global Settings**.
3. In **Global Settings**, locate **Notifications** settings and configure options for the requestor notification email.
